# FOCI-OpenIFS: A flexible climate model for high- resolution simulations

Joakim Kjellsson, Wonsun Park, Sebastian Wahl, Jan Harlaß, Tobias Bayr, Torge Martin, Mojib Latif, Katja Matthes, Arne Biastoch, etc...

Marine Meteorology / Ocean Dynamics,  
GEOMAR Kiel

Glenn Carver  
ECMWF

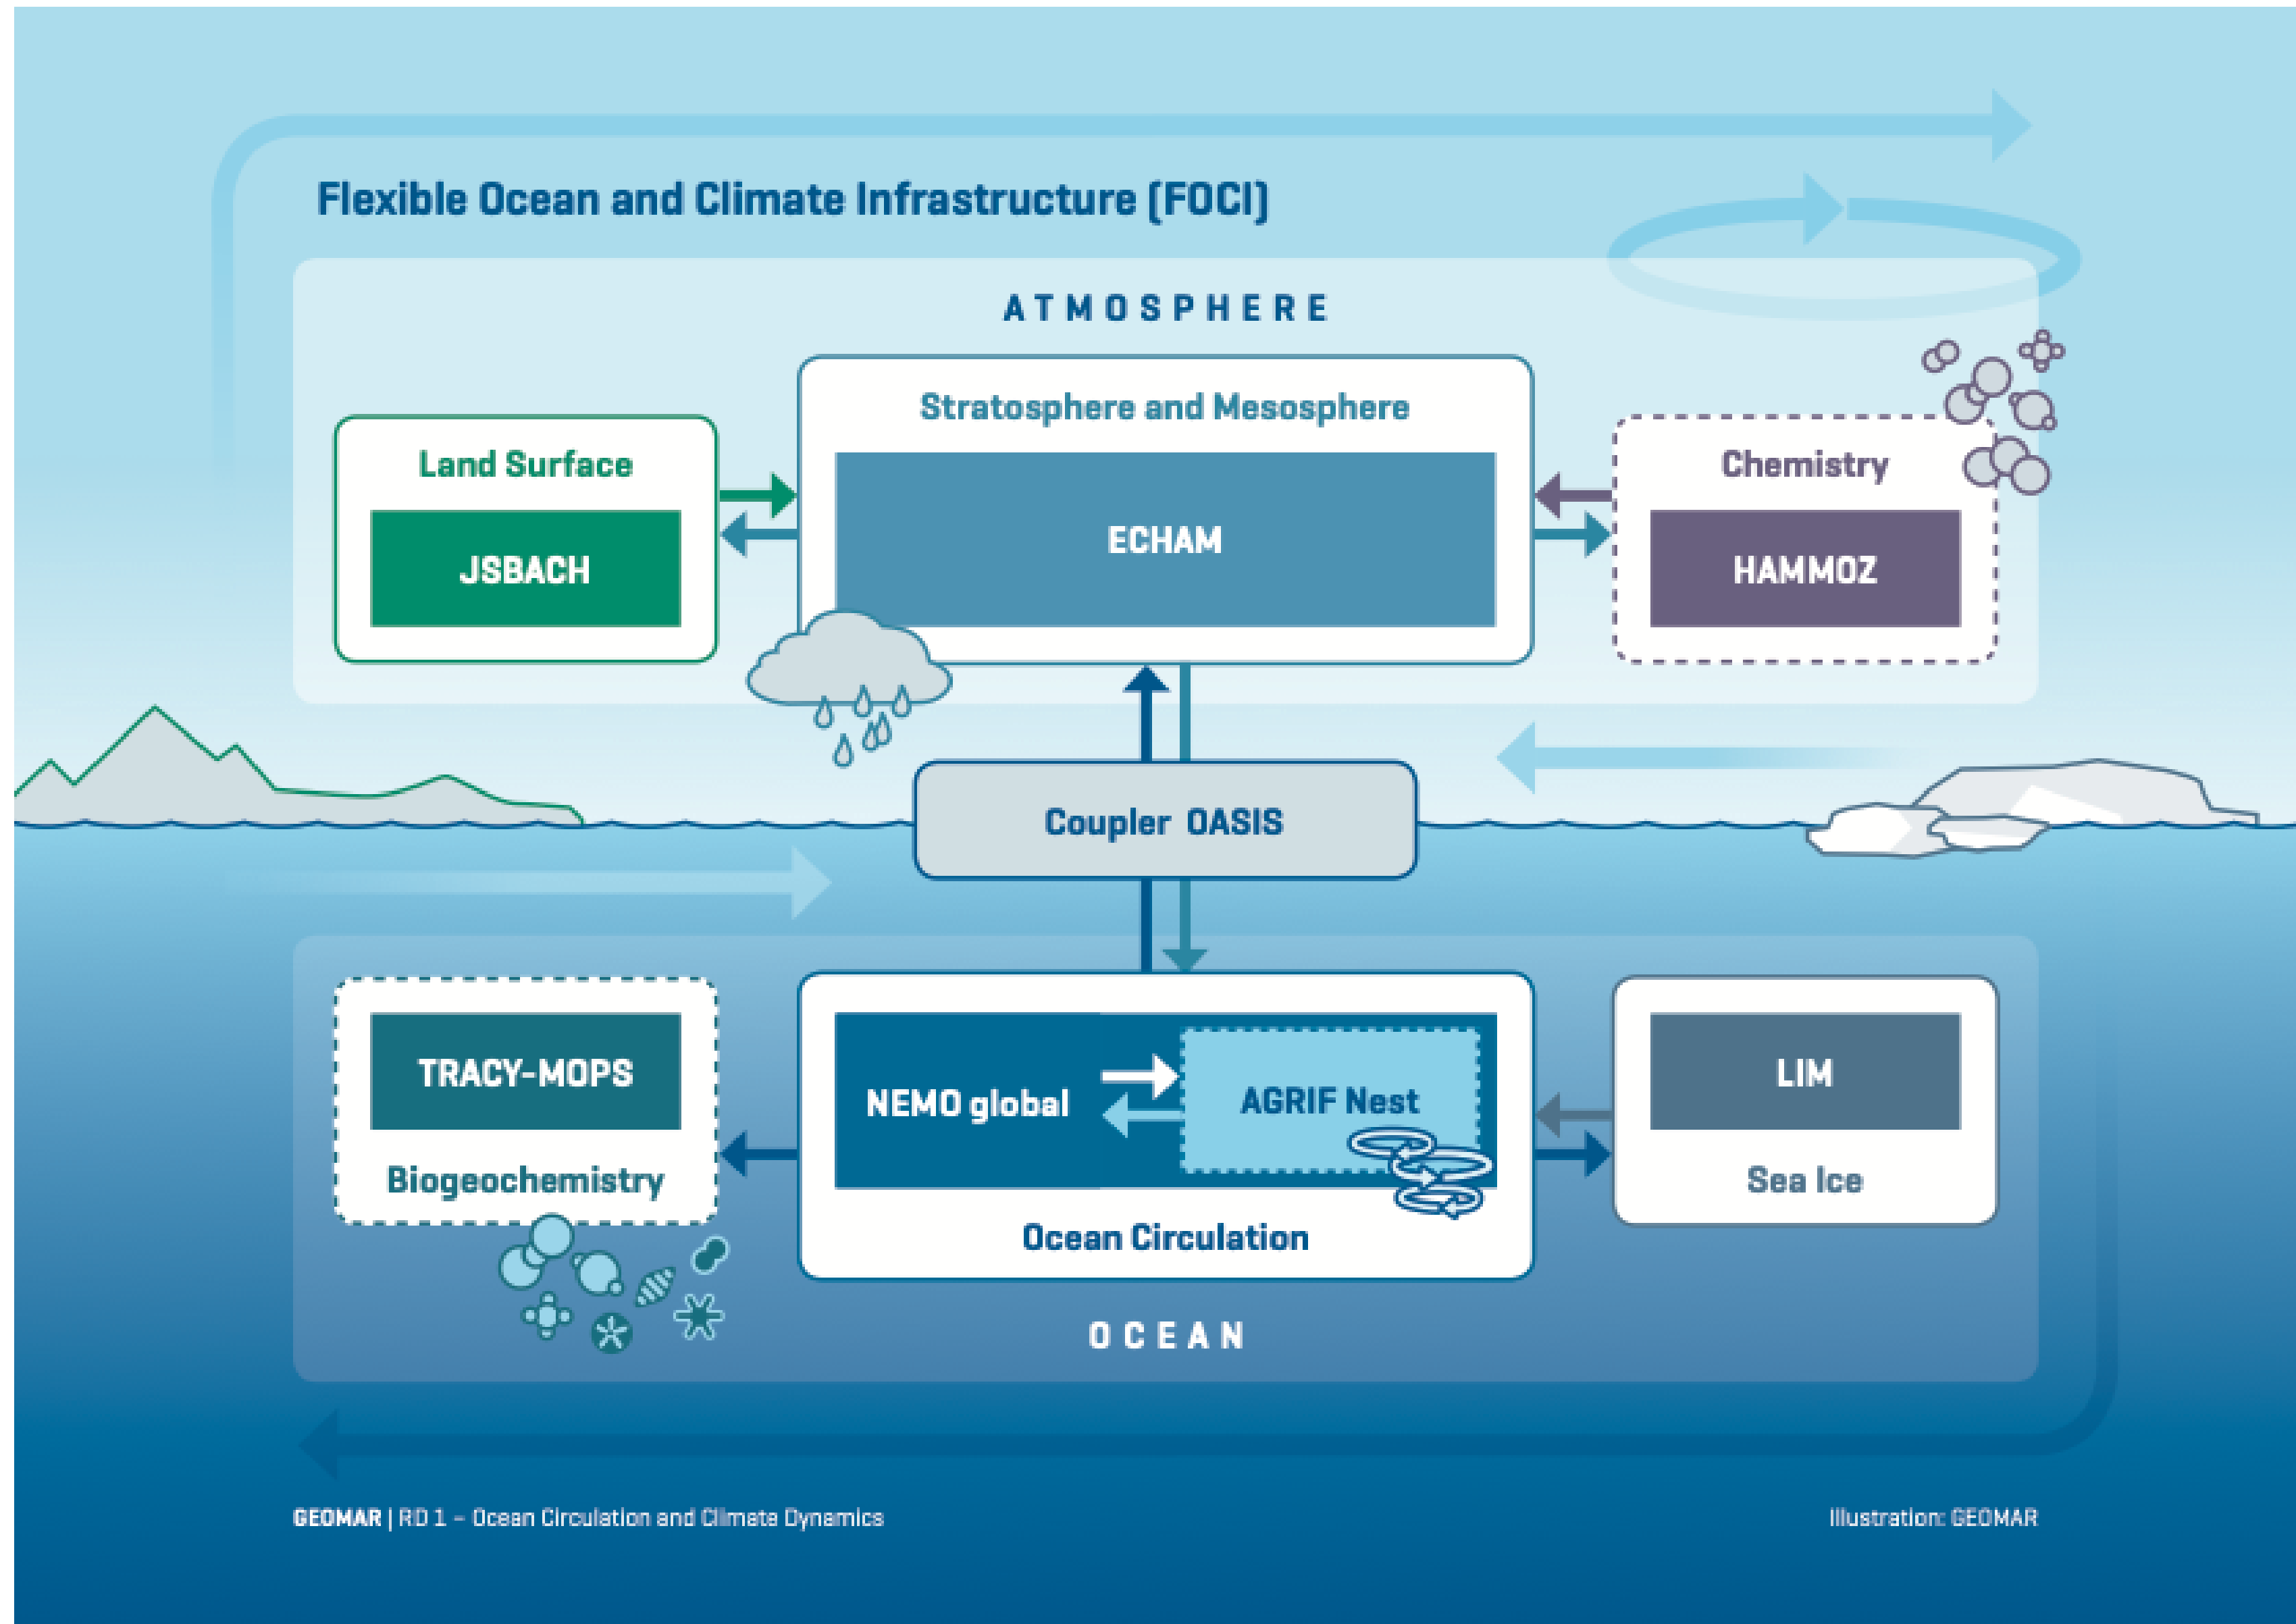

Dirk Barbi  
Jan Streffing  
AWI Bremerhaven

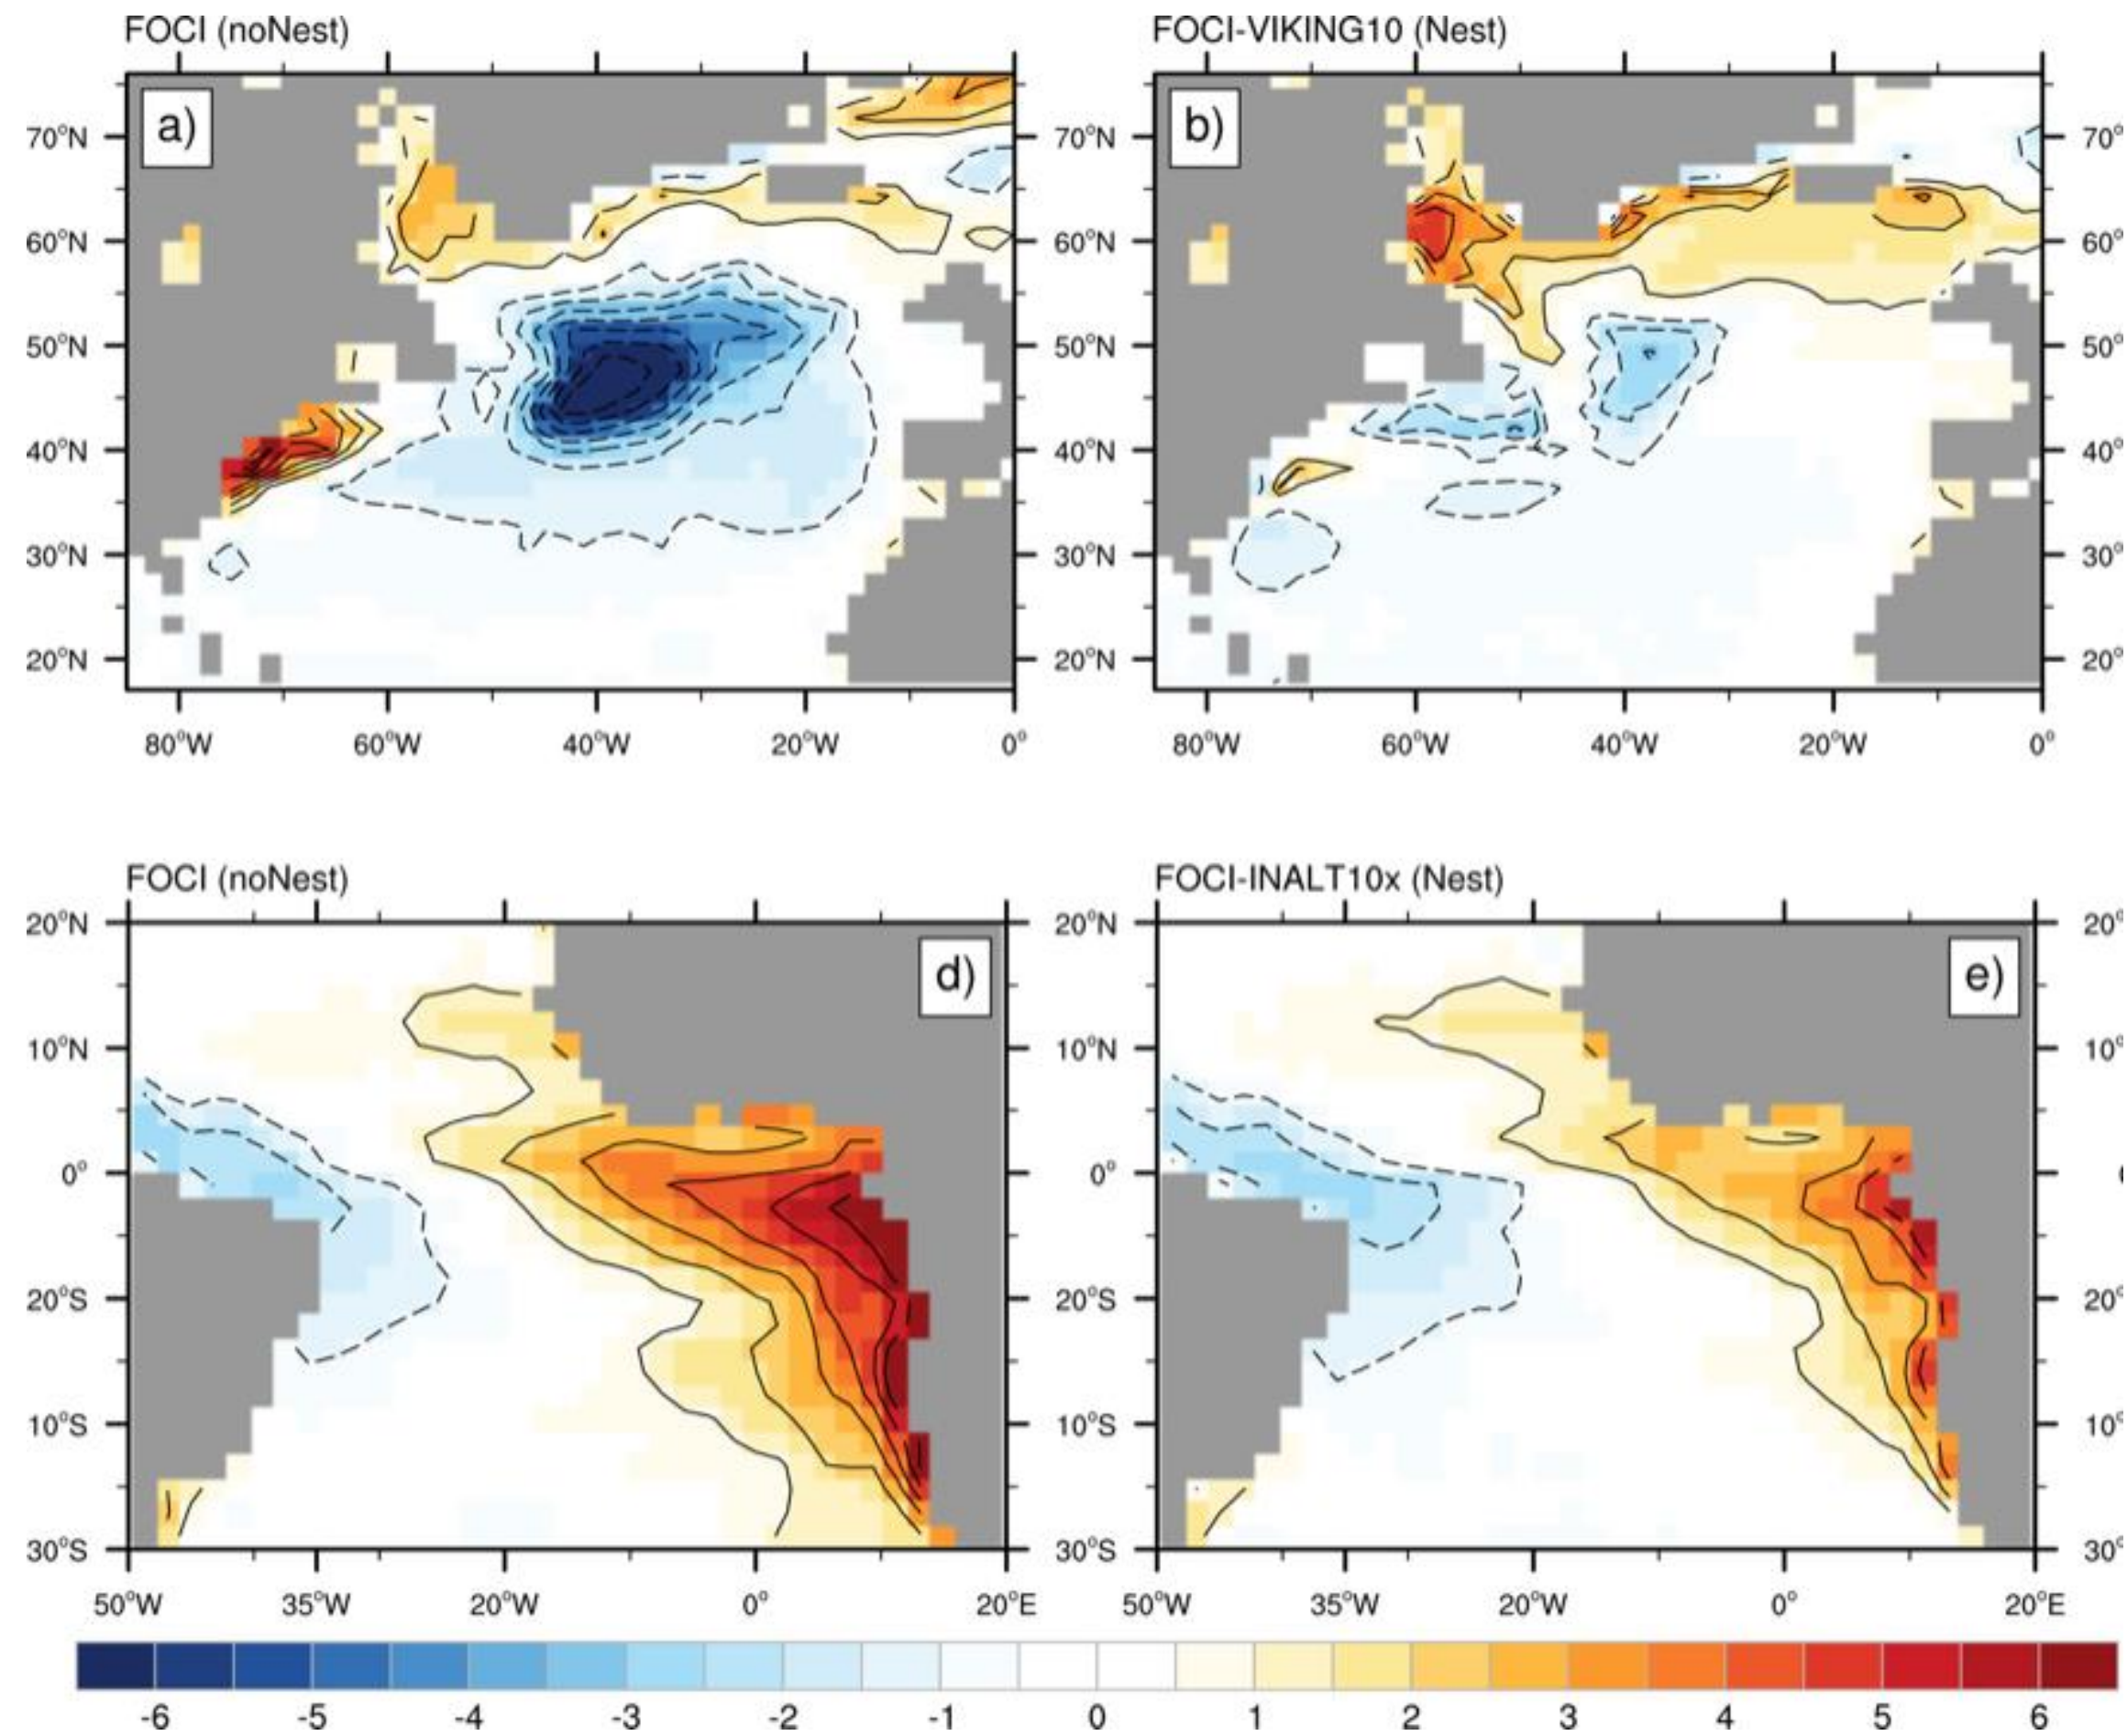

FOCI-OpenIFS T511L91 + ORCA05

- **KCM. ECHAM5 + NEMO 2/3.4 (Park et al. 2008). T<sub>q</sub>31/42/63 + ORCA2/05**  
Long-time workhorse for Meteorology group. No chemistry. No nesting.
- **NEMO v3.6 with AGRIF nesting.**  
ORCA05/025 + INALT10 / INALT60 / VIKING20X.  
Used by Ocean Dynamics group.
- **CESM1 / CAM-WACCM**  
Upper atmosphere dynamics and chemistry modelling in Meteorology group.
- **FOCI (Flexible Ocean and Climate Infrastructure).**  
**ECHAM6 + NEMO 3.6, T<sub>q</sub>63 + ORCA05 + AGRIF.**  
+ (HAM)MOZ chemistry, TRACY-MOPS ocean biogeochemistry.  
Currently used in a variety of projects by Meteorology, Ocean Dynamics, and Biogeochemistry groups.
- **FOCI-OpenIFS. T<sub>L</sub>159 / T<sub>L</sub>511 + ORCA05 ( + AGRIF).**  
OpenIFS cy40 + NEMO 3.6. FOCI without chemistry or biogeochemistry.  
Plans for OpenIFS cy43 & HD.

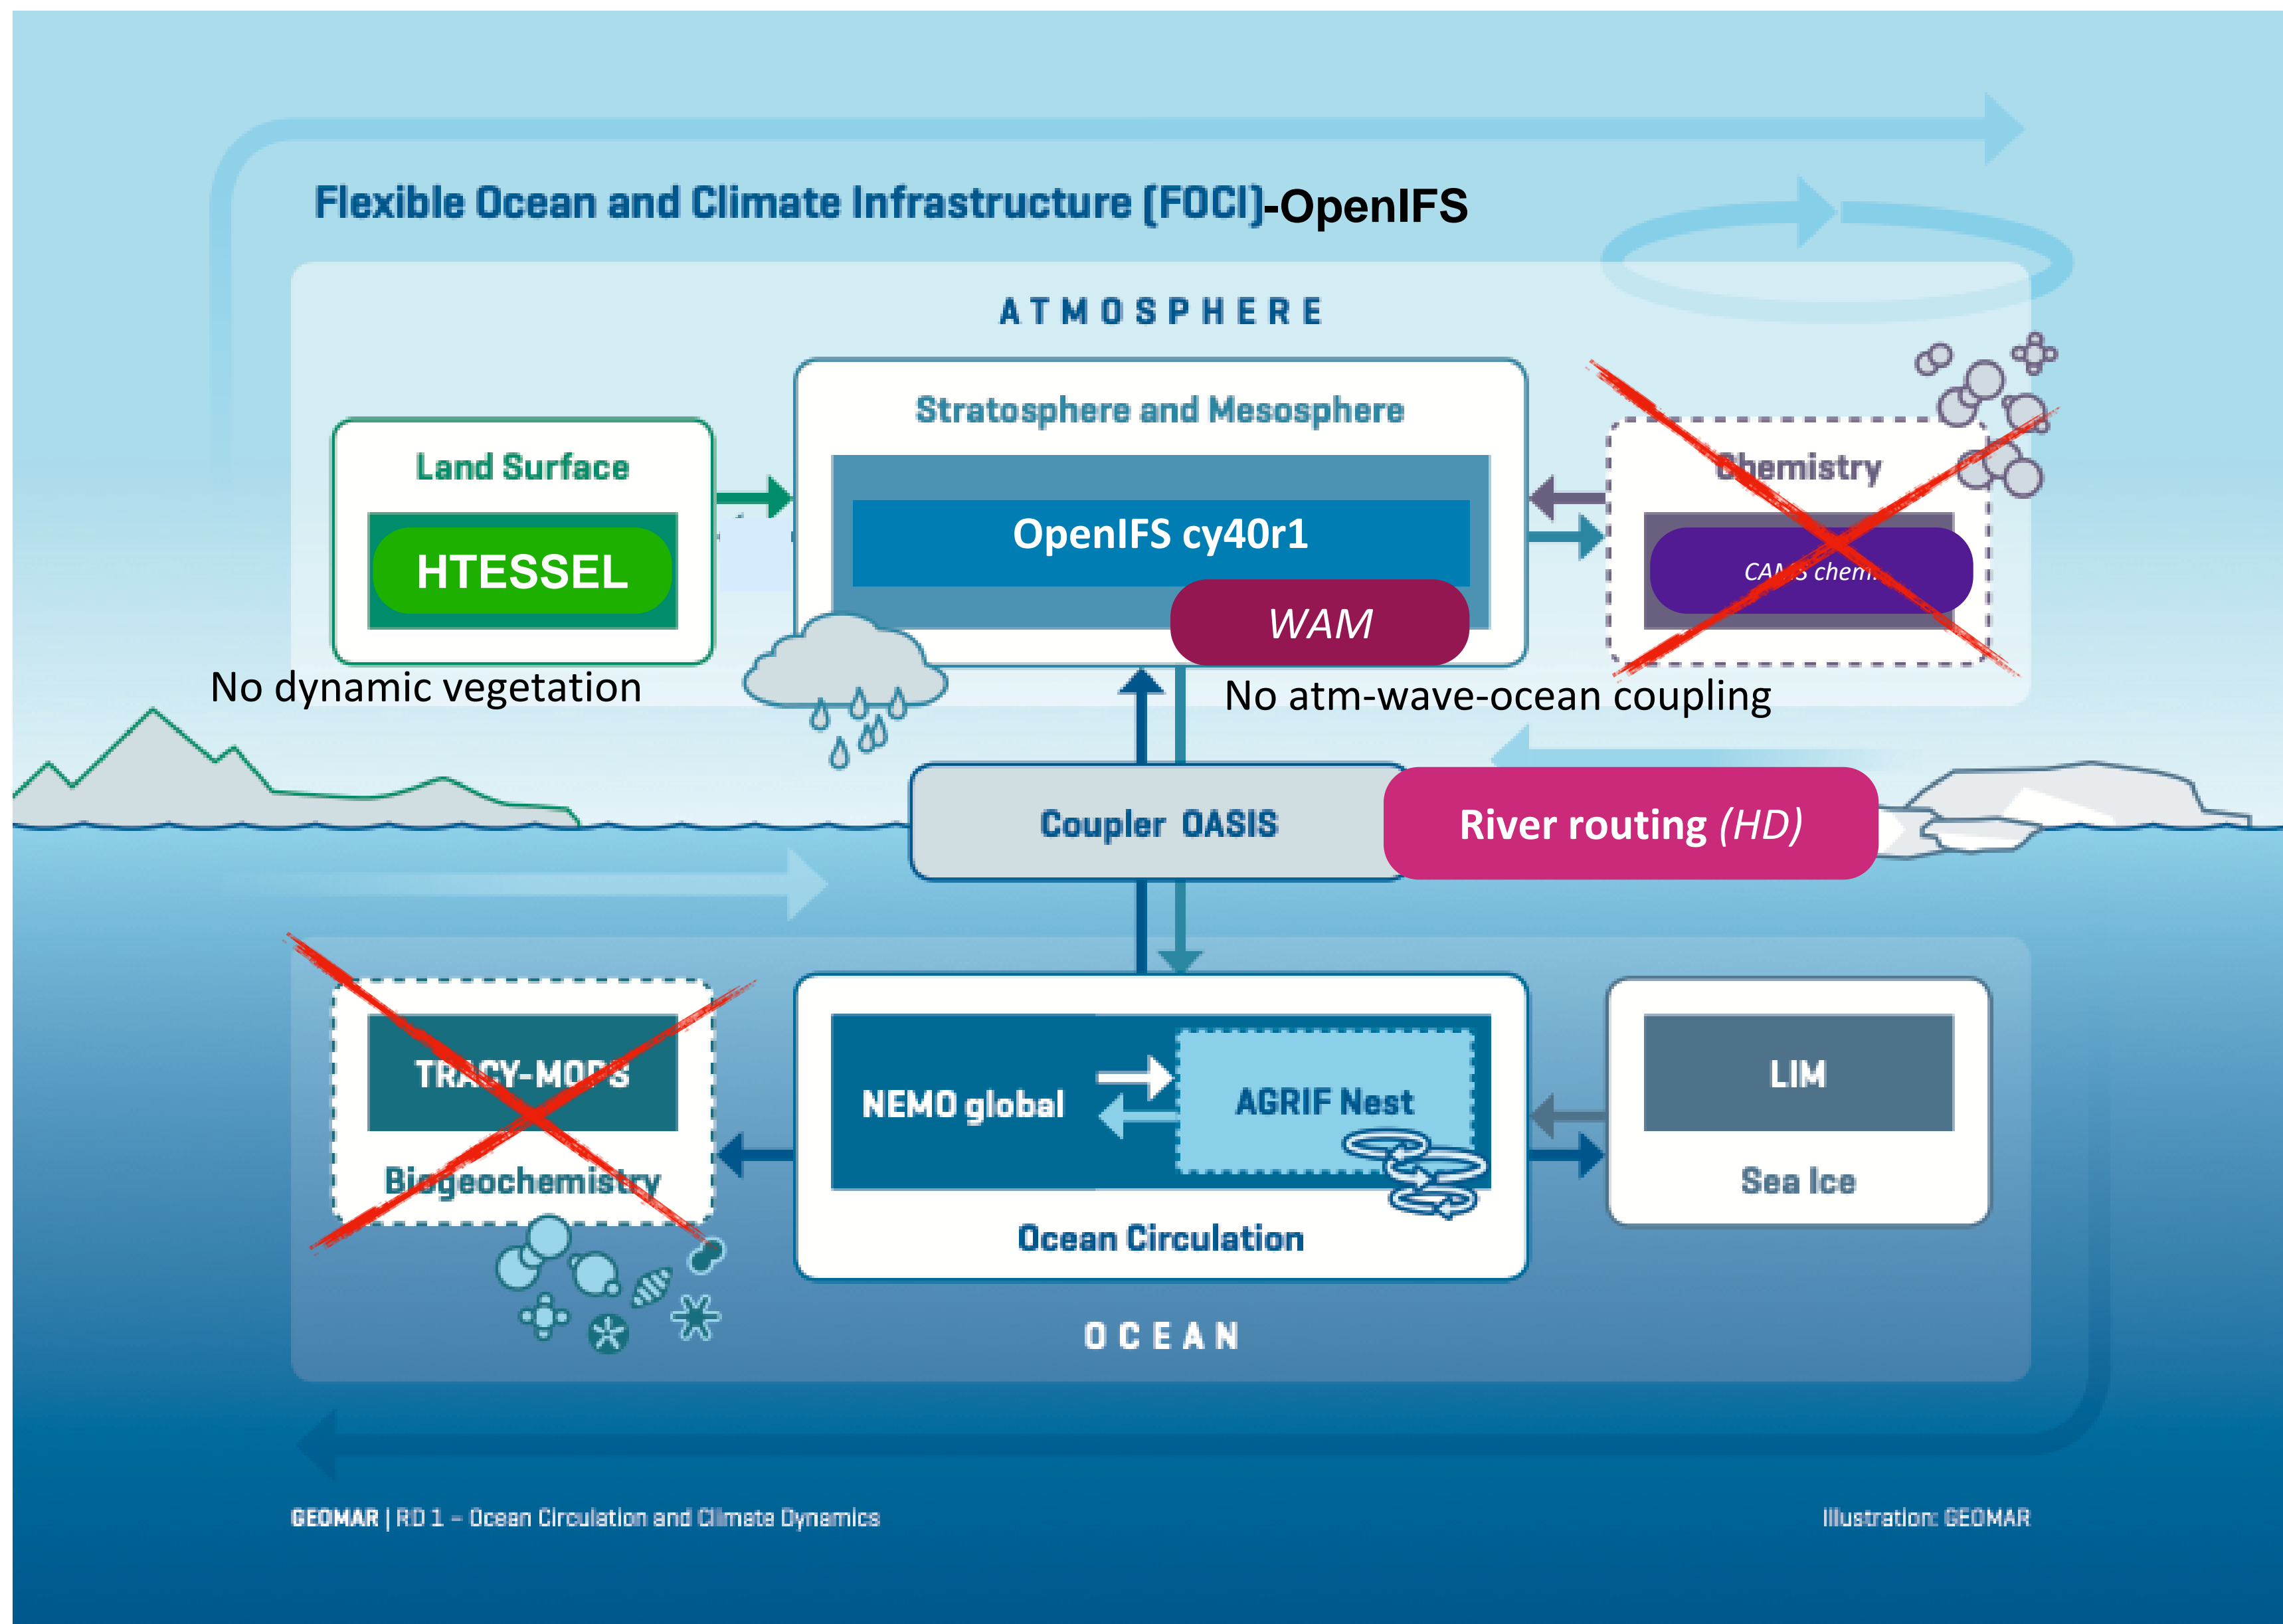

**ECHAM6 T63 +  
NEMO ORCA05 +  
VIKING10X**

**ECHAM6 T63 +  
NEMO ORCA05 +  
INALT10X**

- Global 0.5° with 1/10° locally. Common biases reduce.

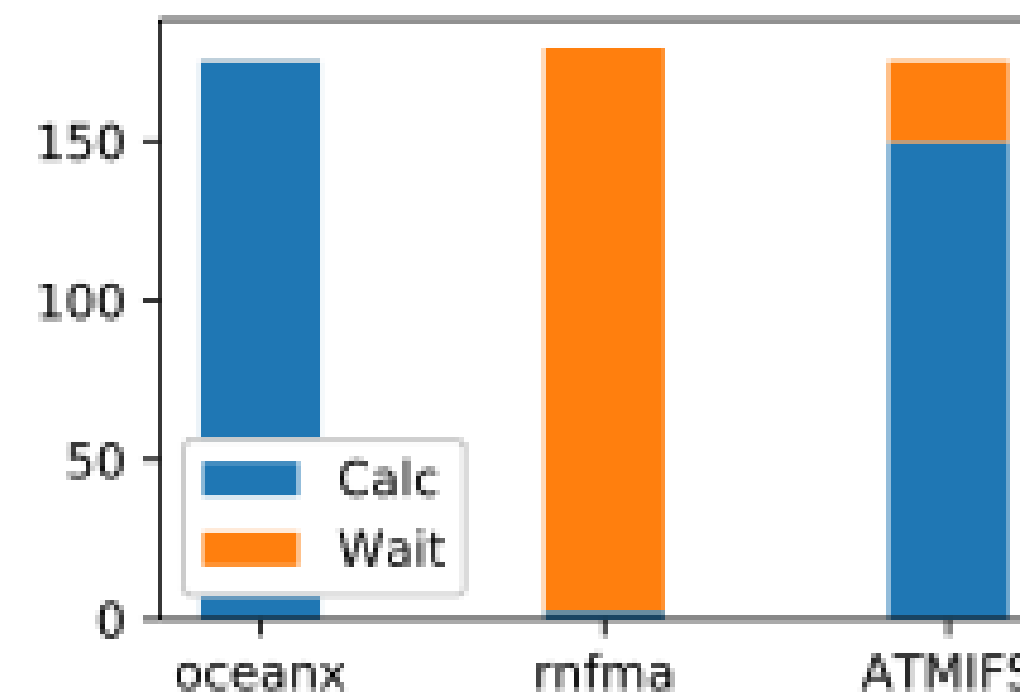

- ECHAM development is discontinued. ICON is future for MPI-M.
- We want to go finer than 0.5° resolution, especially when coupled to AGRIF.  
dx < 50 km not feasible with ECHAM6.  
OpenIFS uses half the CPUs for double resolution compared to ECHAM6.
- OpenIFS can take a lot longer time steps than ECHAM6. Reduced grid.

HLRN-IV: Intel Skylake Gold 6148 (40 CPU/node)

	CPUs	CPU-h
<b>FOCI-OpenIFS T159L91 + ORCA05</b>	279+1+480 (IMPI 2018)	570
<b>FOCI T63L95 + ORCA05</b>	600+480 (IMPI 2019)	540

FOCI speeds up greatly from IMPI 2019, but FOCI-OpenIFS slows down!  
We need IMPI 2019 for XIOS in detached mode.

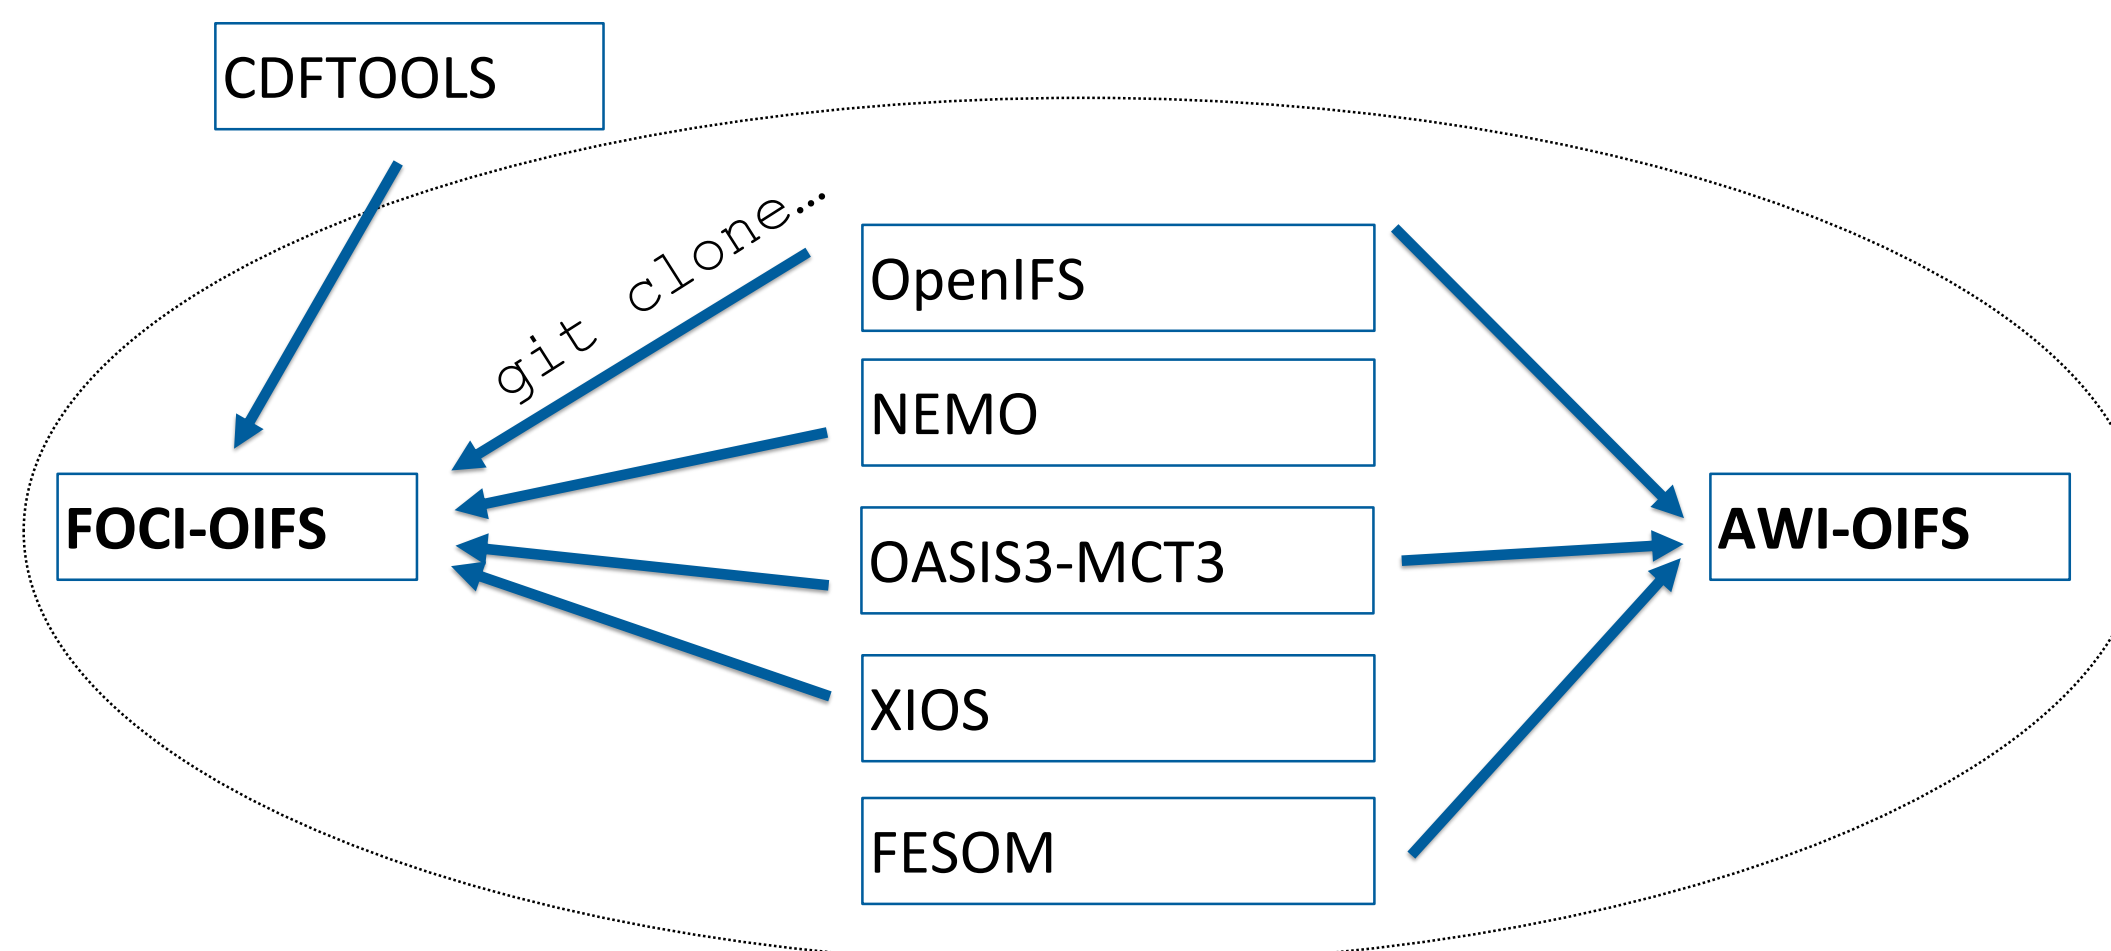

OpenIFS, T159L91 @ 279 CPUs  
NEMO, ORCA05L46 @ 480 CPUs  
River routing @ 1 CPU

Typical ESM

**FOCI 1.13**  
 -ECHAM  
 -NEMO  
 -XIOS  
 -OASIS  
 -etc.

With ESM-Tools

- Developed at AWI by Dirk Barbi et al. Allows the same infrastructure (compiling, fetching forcing files, restarting, storing output) for a variety of ESMs.
- Groups using different coupled models can co-develop individual model components, e.g. OpenIFS for AWI-CM3, FOCI-OpenIFS, and standalone.
- Used for standalone OpenIFS and coupled FOCI-OpenIFS, for FOCI (next week), and NEMO (future).

	OIFS	NEMO	Run time	Settings
<b>FOCI-OIFS LR</b>	T <sub>L</sub> 159L91	ORCA05 L46	32 SYPD @ 760 CPU ~ 570 CPUh	No WAM
<b>FOCI-OIFS MR</b>	T <sub>L</sub> 511L91	ORCA05 L46	LUCIA analysis in progress	No WAM
<b>FOCI-OIFS ORION</b>	~0.25°?	ORCA05 L46 (+ "ORION12")	Planned for SO-CHIC	AGRIF nest over Southern Ocean
<b>FOCI-OIFS VIKING</b>	~0.25°?	ORCA05 L46 (+ VIKING10X)	Planned for new project	AGRIF nest over North Atlantic

- "MR" configuration still needs testing.
- "ORION" and "VIKING" configurations require work on coupling (this autumn).
- Will switch to CY43 and new grid.

**FOCI (T63 + ORCA05)**

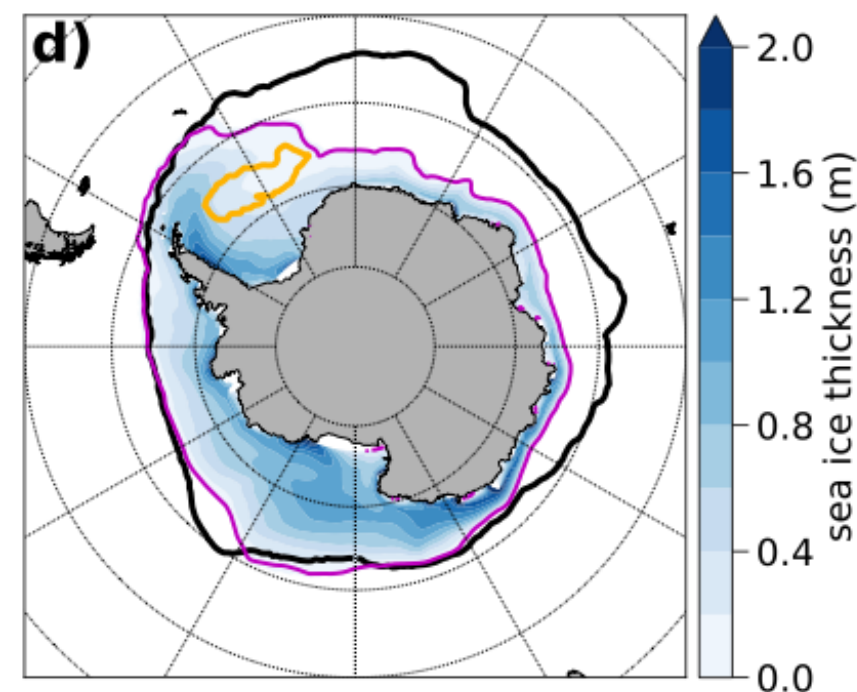

**FOCI-OpenIFS (T159 + ORCA05)**

**HadISST**

**FOCI**

**FOCI-OpenIFS**

- Warm bias closely linked to sea-ice bias.
- FOCI-OpenIFS worse than FOCI. But better for tropical Atlantic (due to resolution?)
- Caused by errors in cloud scheme?
- Weak ACC in FOCI, FOCI-OpenIFS and forced ORCA05 runs.

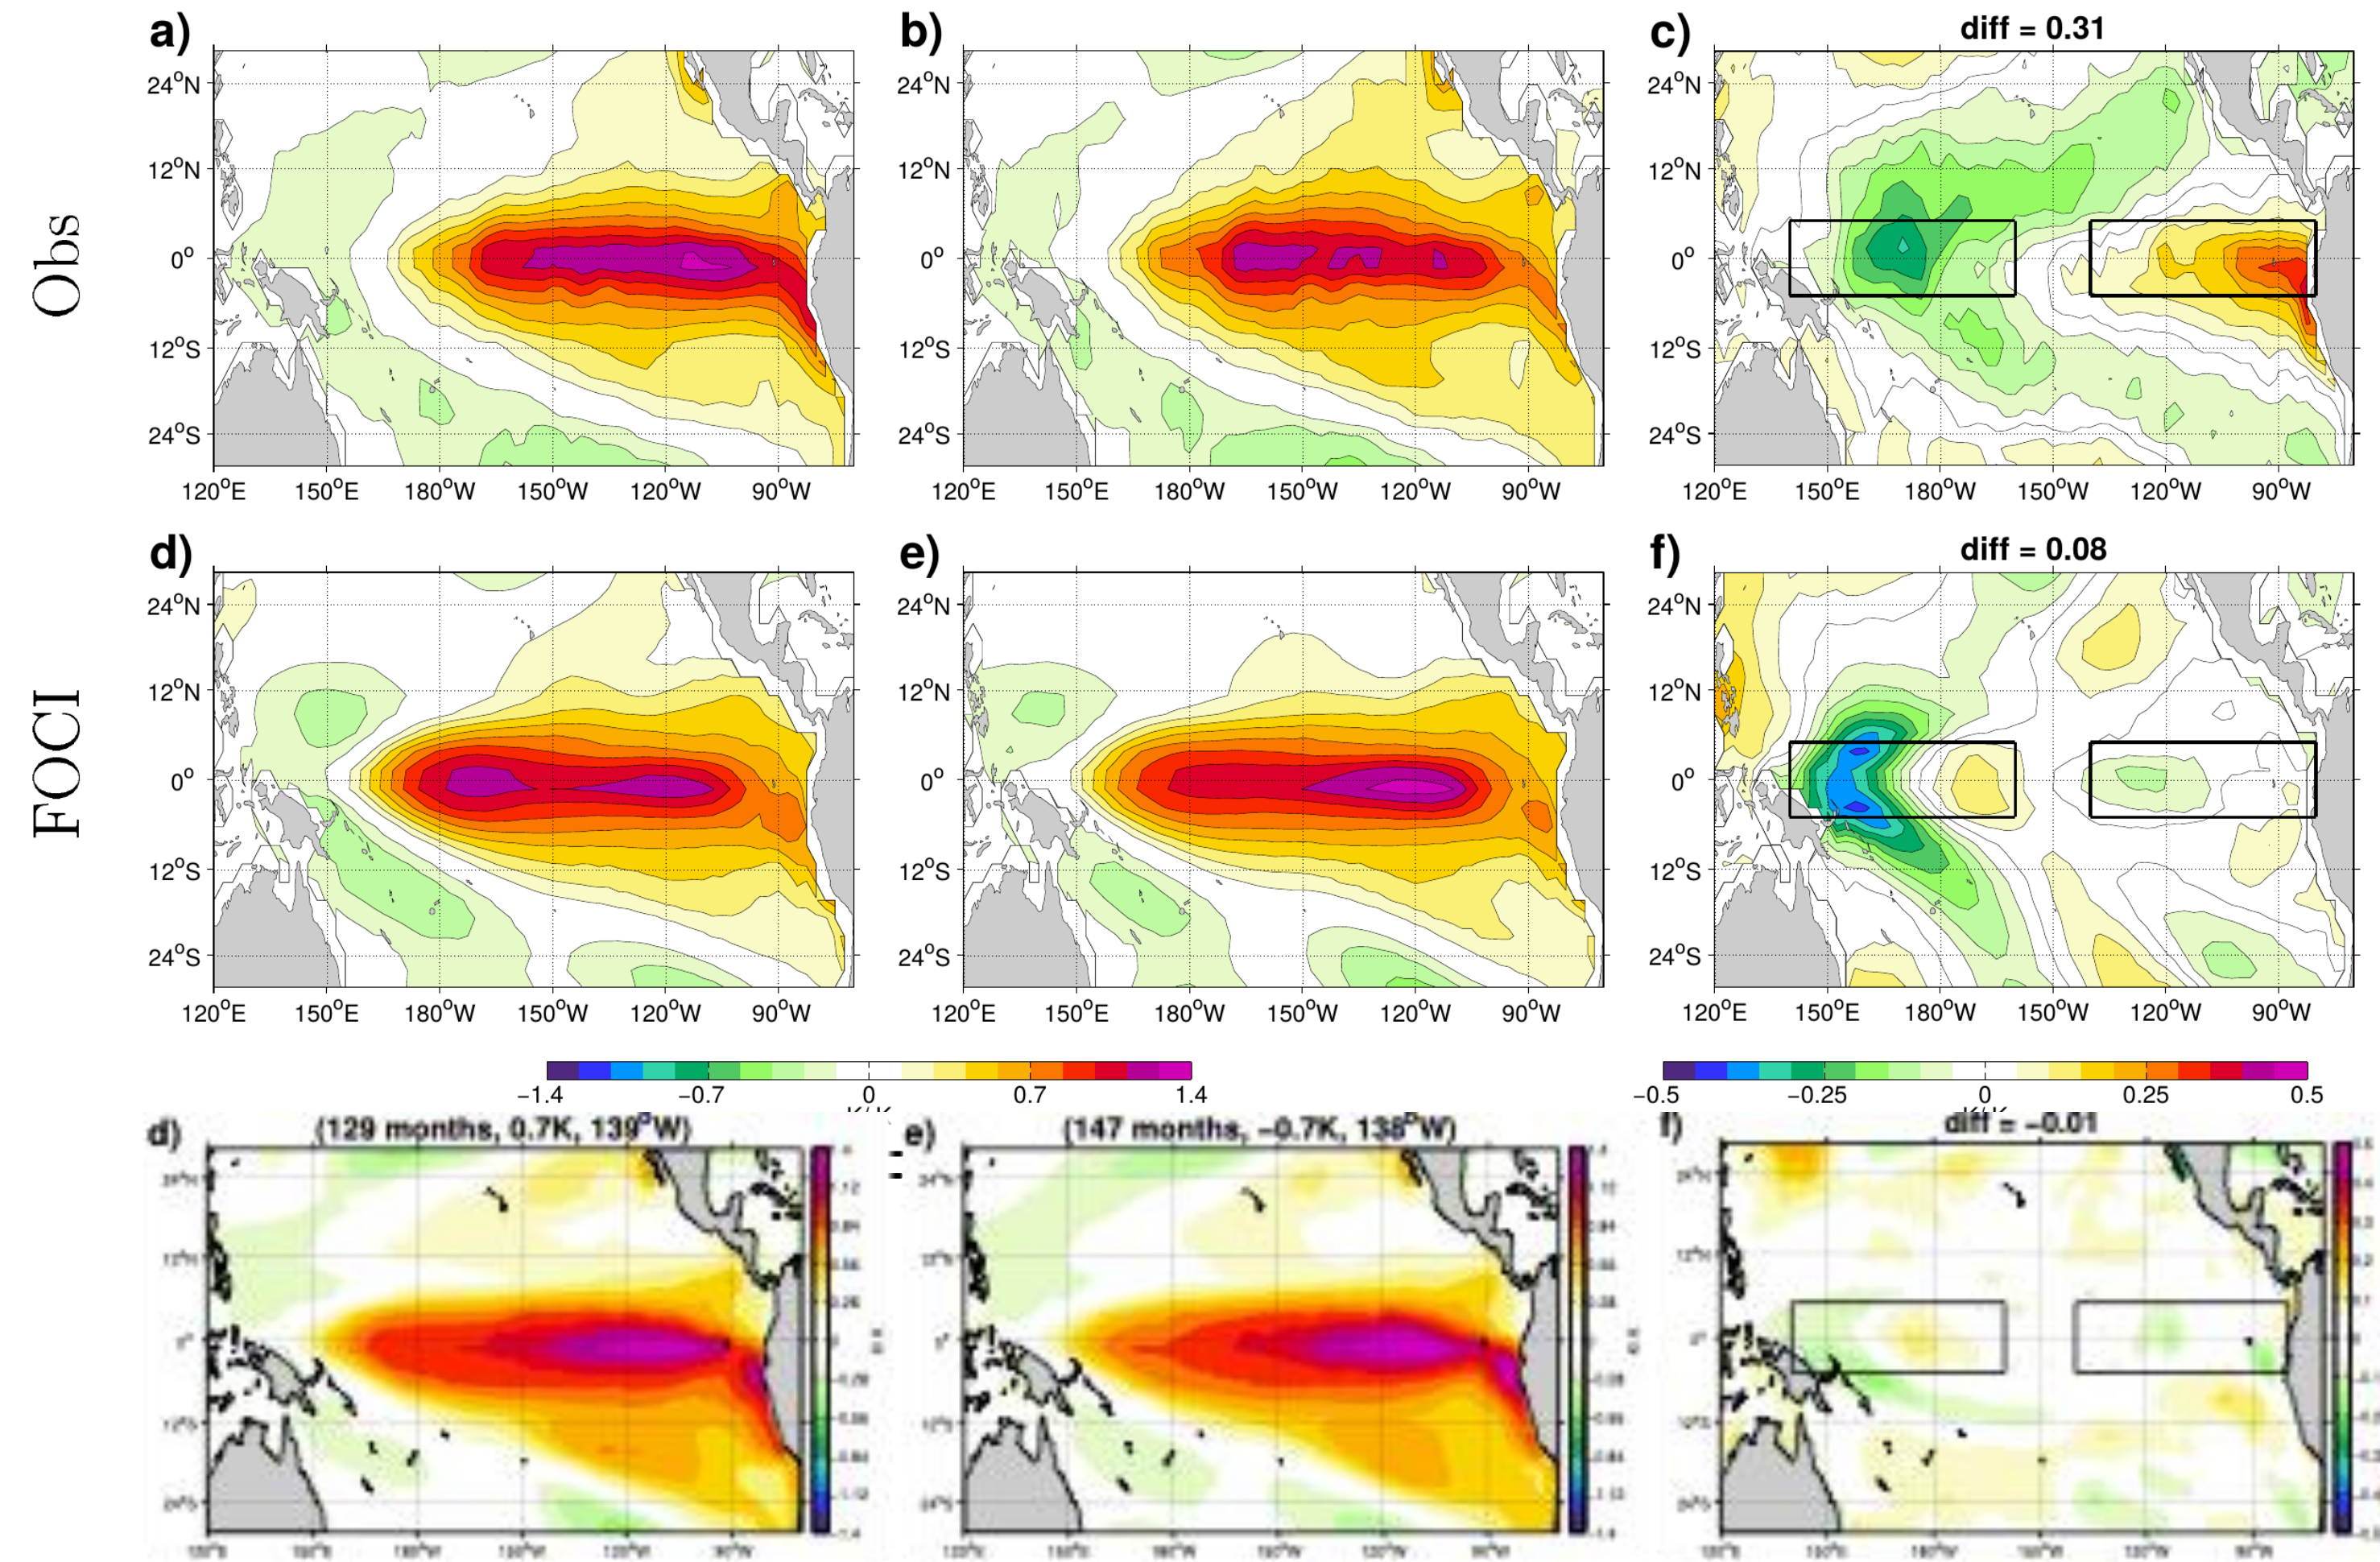

## ENSO Composites

El Niño

(-) La Niña

El Niño - La Niña

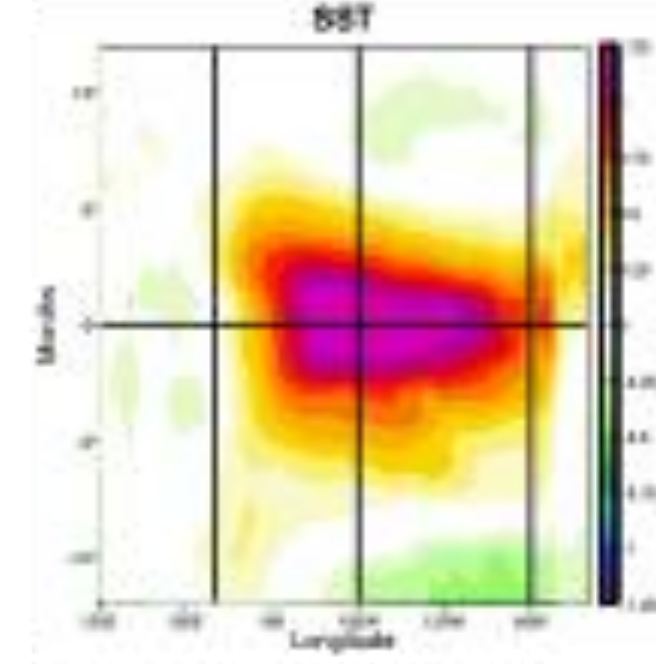

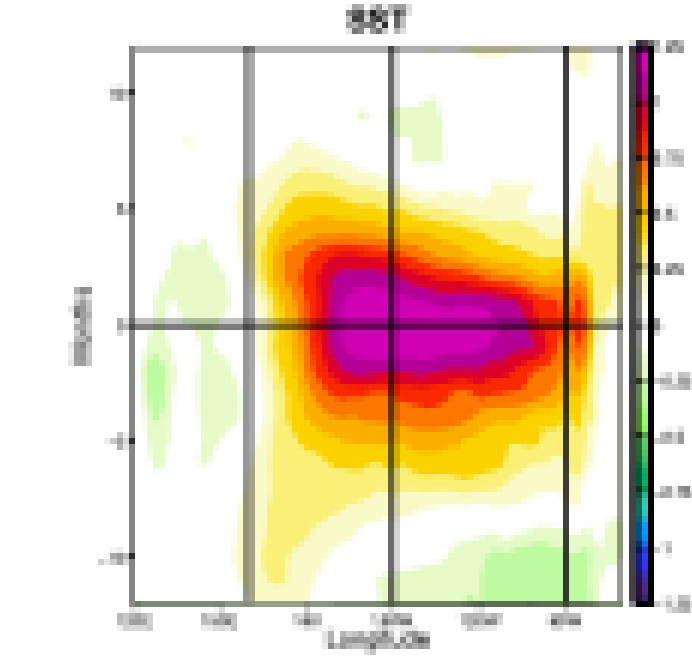

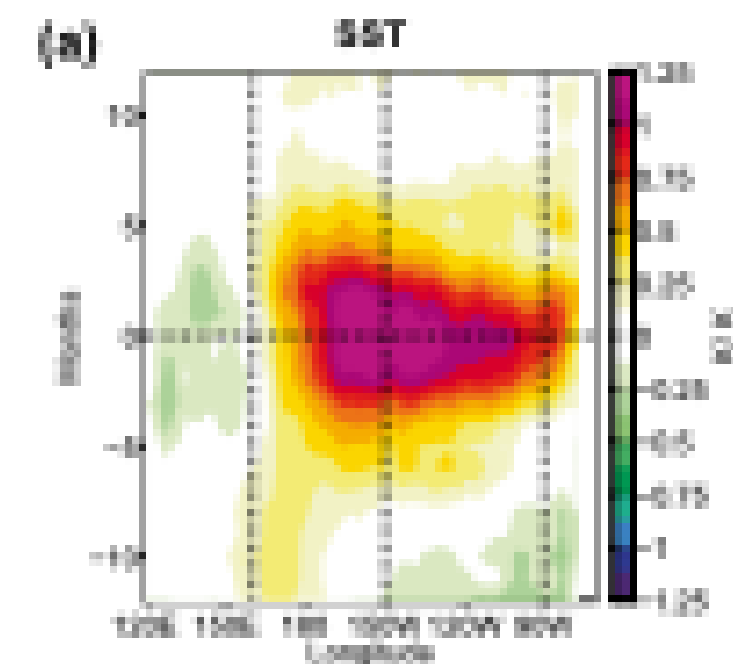

## Obs + ERA-Interim

## AMIP T159L91

## AMIP T511L91

**SST**

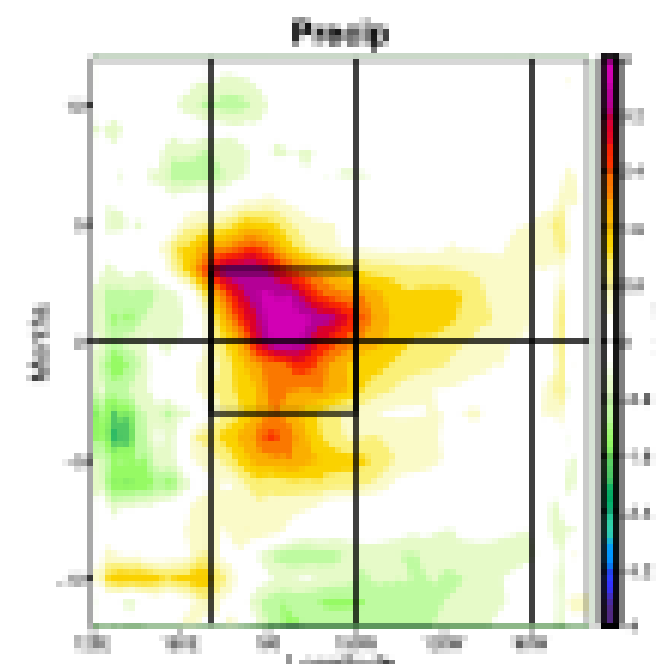

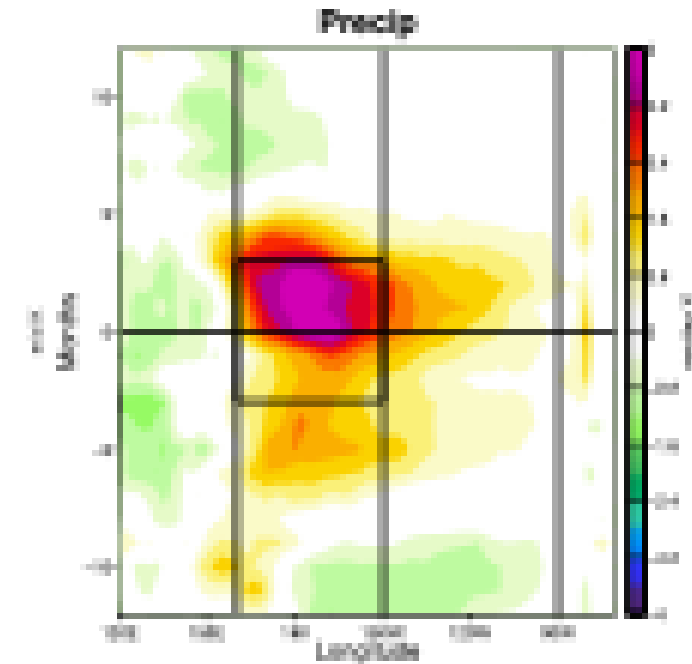

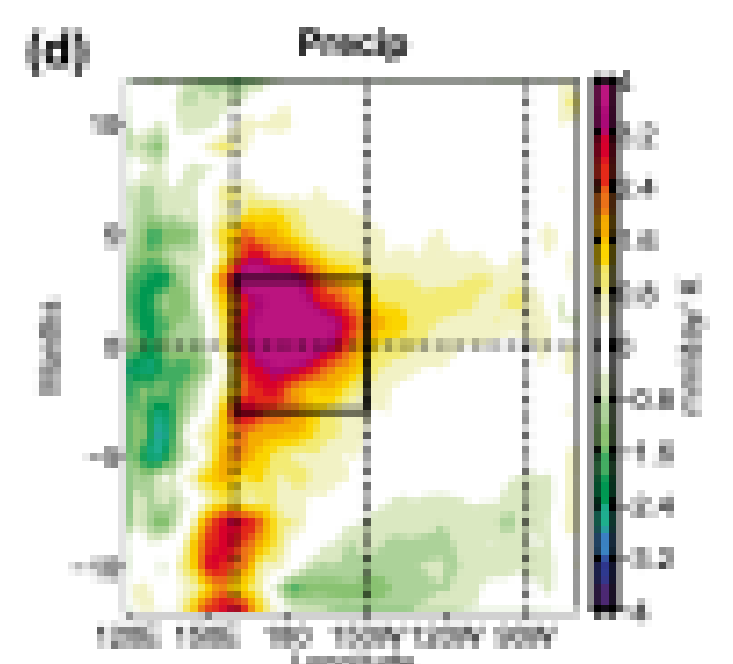

- Forced by obs SST/SIC 1982-2016.

**Heat flux**

- T159 has an easterly wind bias. T511 slightly better.

- No improvement of feedbacks in T511.

**Precipitation**

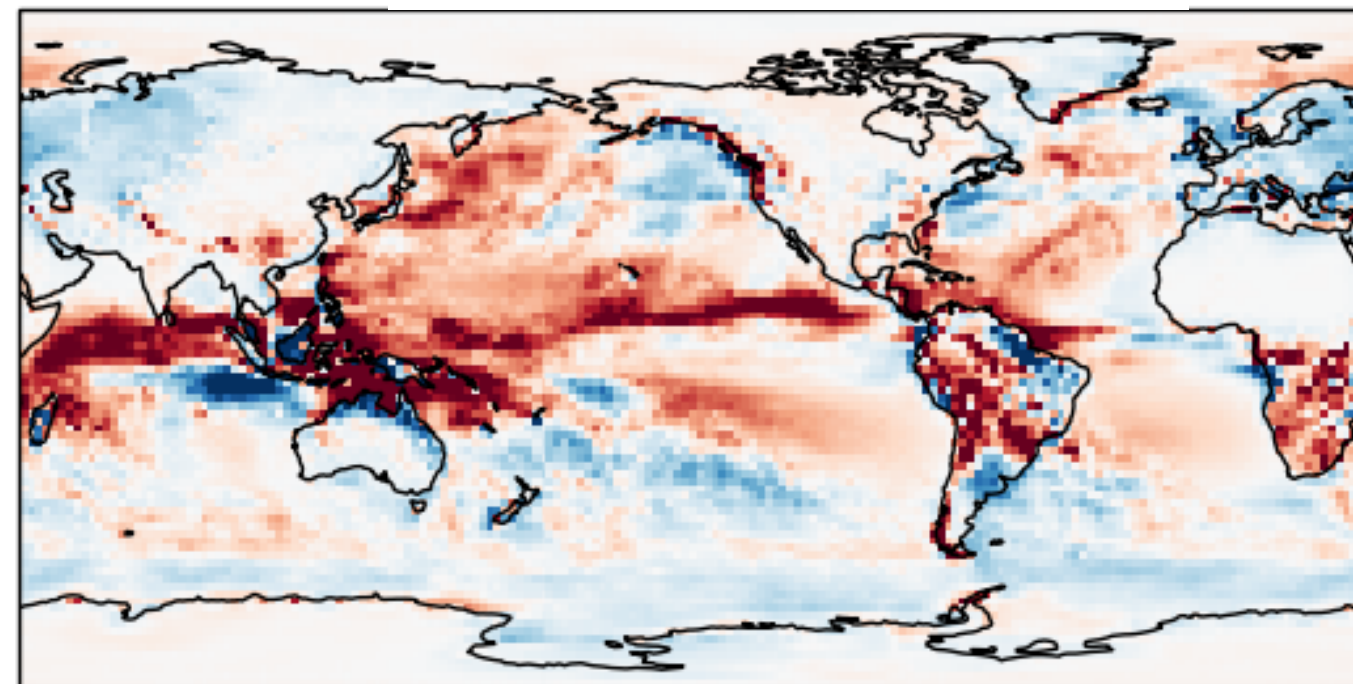

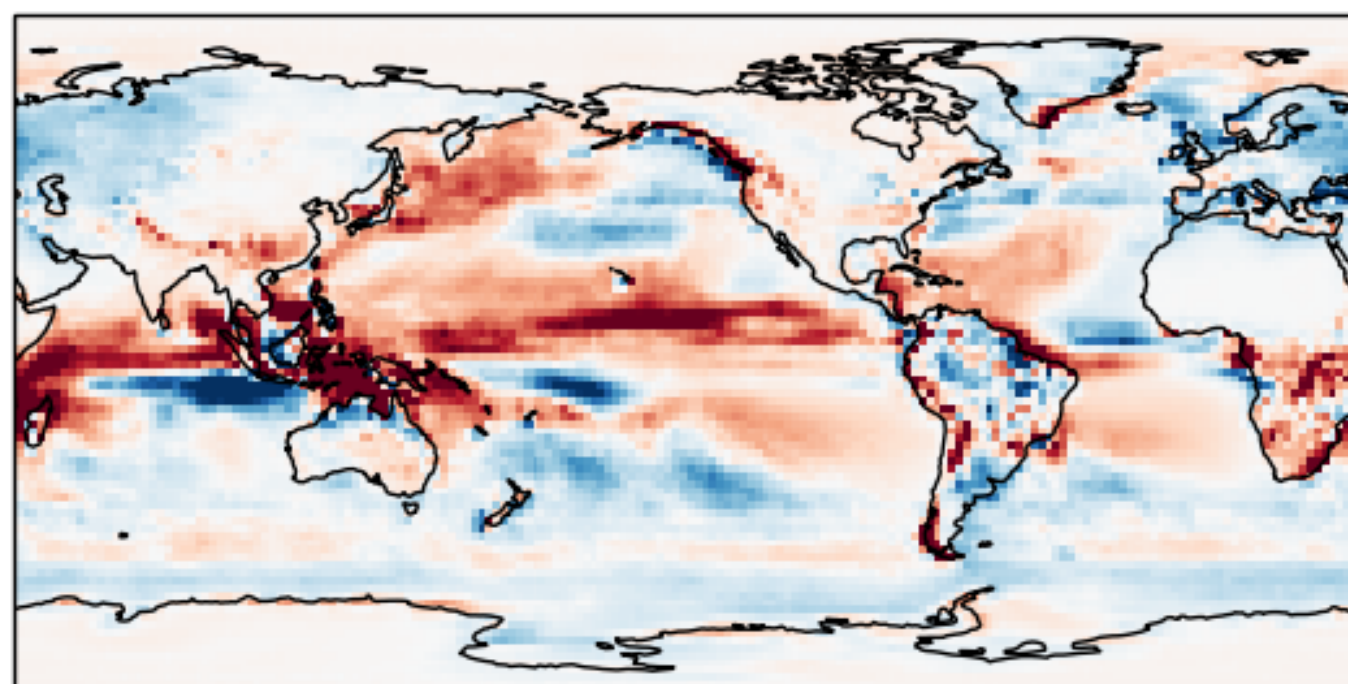

- SPPT / SKEB.

- Tuning exercise in progress.

OpenIFS T159

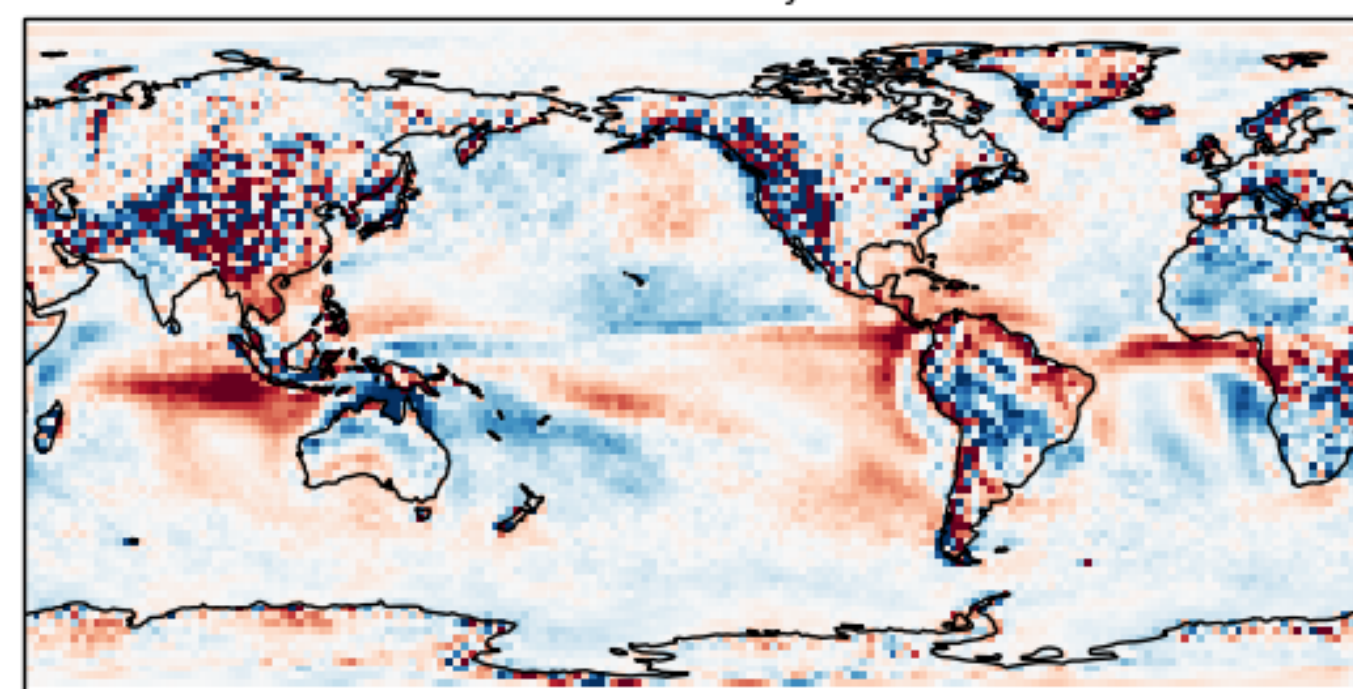

OpenIFS T511

Precip

season = DJF

season = DJF

W (500 hPa)

season = DJF

season = DJF

Cloud rad.  
effect

- AMIP with standalone T<sub>L</sub>159, T<sub>L</sub>511, T<sub>L</sub>1279.
- Coupled T<sub>L</sub>159 + ORCA05 & T<sub>L</sub>511 + ORCA05.
- SO-CHIC simulations coming. OpenIFS + NEMO + AGRIF.  
Requires direct OpenIFS -> AGRIF coupling (dedicated OASIS support).
- Some large biases (Southern Ocean, ENSO) but nothing out of the ordinary.  
Biases reduce somewhat at T511. Tuning of cloud parameters in progress!  
Test new supercooled liquid cloud water scheme from CY45?
- We like OpenIFS! We are eagerly awaiting CY43R3, XIOS and full/reduced chemistry.
- Run with any SST/SIC. Start from ERA-I or ERA5?  
Metview scripts for post processing, i.e. grib->netcdf & spectral transforms.  
CDO is really slow, and might not handle new grids.
- Ref. paper for FOCL (Matthes et al.) in prep.

Can you see  
anymore model  
bugs?

No, but I'm sure  
they're out there...

- Make OASIS interfaces (or steal from CY43).
- Lakes are treated as ocean!
- Can not run longer than 44 years (integer overflow).
- GRIB limits the run period to 1900 - 2155.
- Reduce output as much as possible.
- Pray...

~ 20 m thick sea-ice suddenly grows in the tropics!  
 Creates massive SST/SSS gradients and insane velocities.  
 OpenIFS error / NEMO error / HPC error

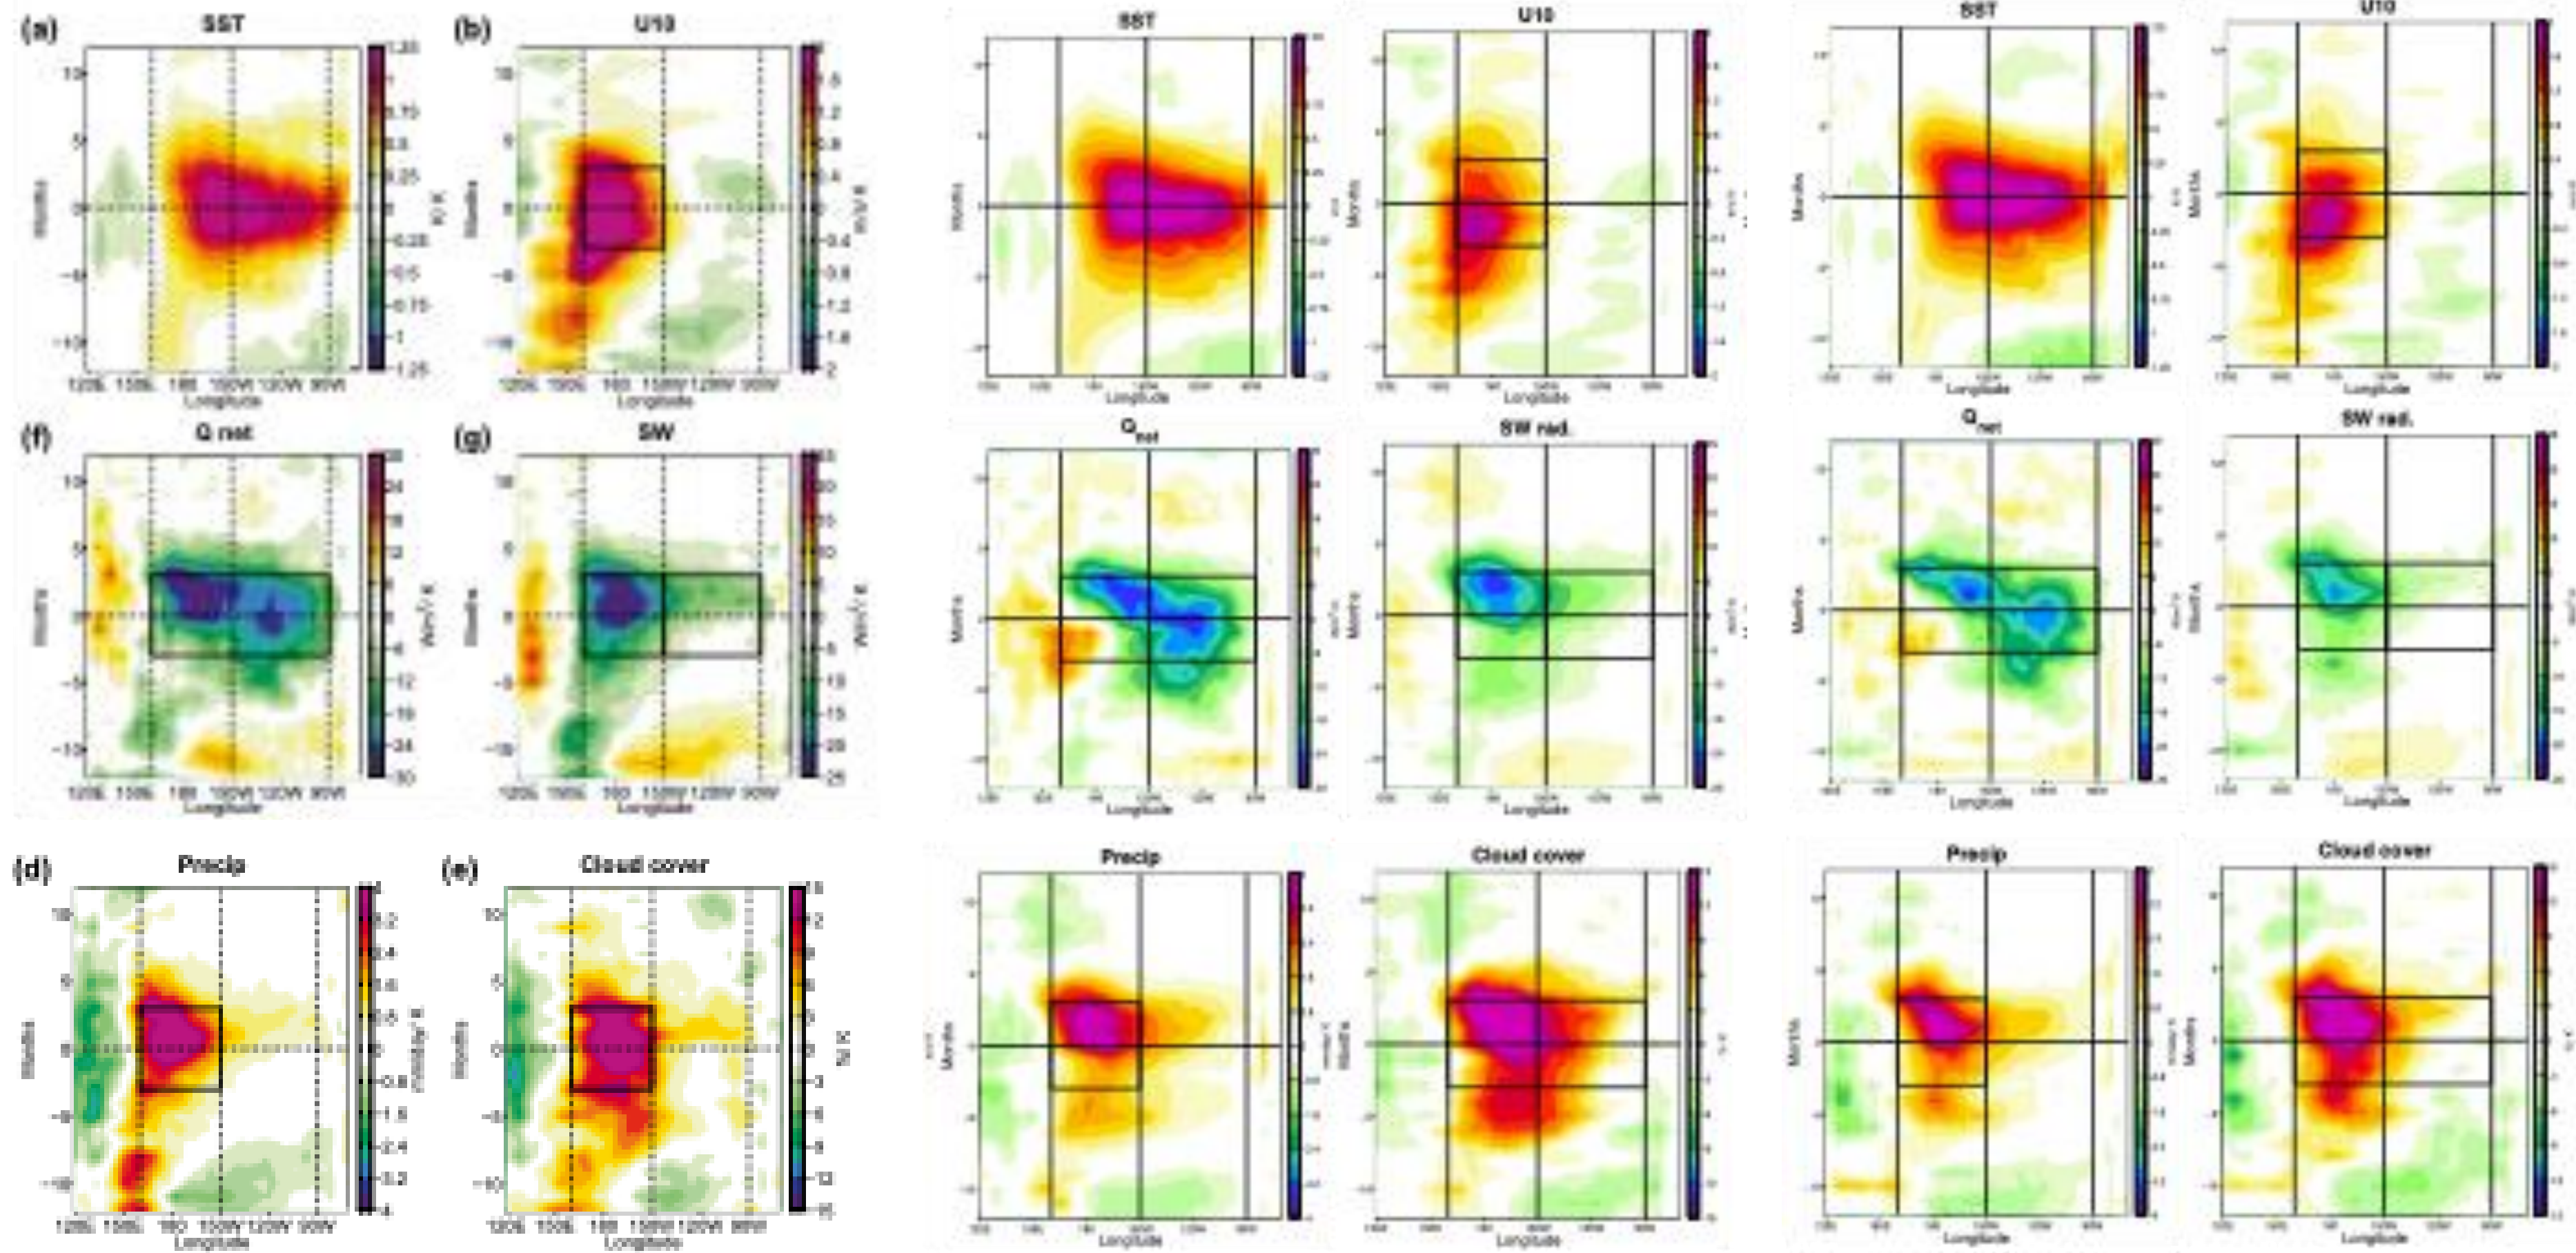

## Obs + ERA-Interim

## AMIP T159L91

## AMIP T511L91

Bayr et al. (CD, 2018)

- Too weak wind feedback. Precip and cloud feedbacks are too late!
- T511 worse than T159!

OIFS 400  
NEMO 400

Send oce->atm  
in one call

OIFS 800  
NEMO 400

Send oce->atm  
in one call

Bundling oce->atm fields reduces run time by ~ 20%

Initialisation  
Write initial state  
Set up coupling

First coupling step

Output

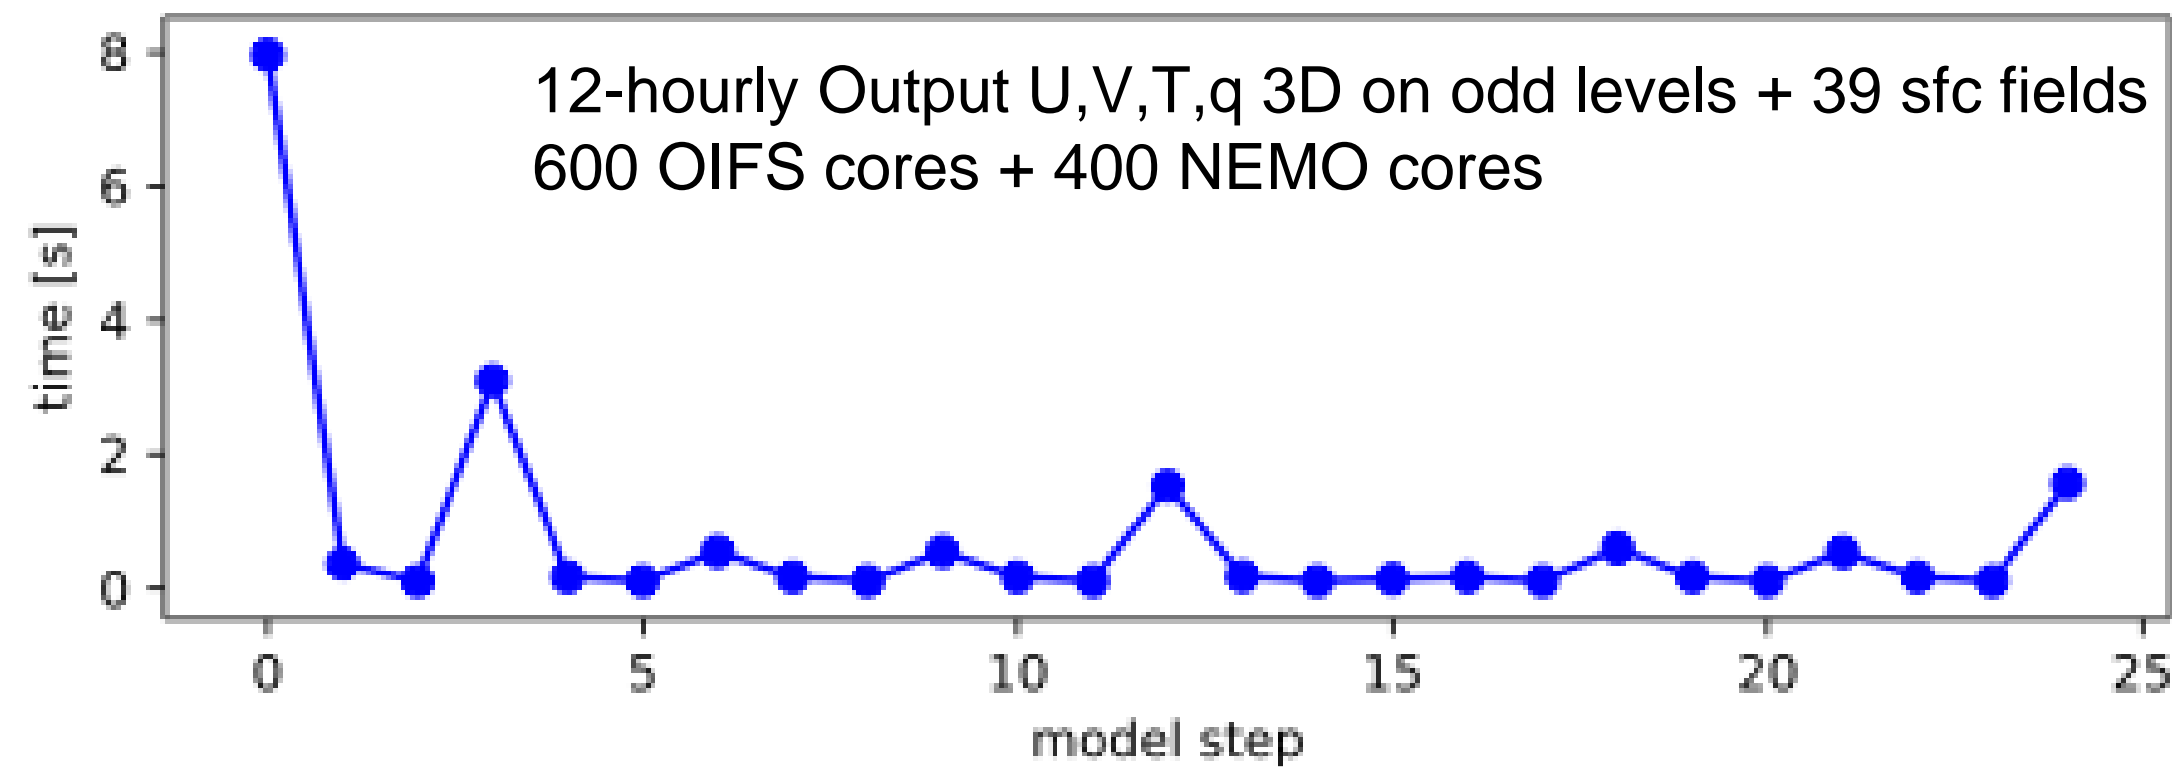

One time step takes ~ 0.2s  
 One output step takes ~ 4s  
 Number hardly change when doubling OIFS cores.  
 Are we at the limit of speed already at 400 OIFS cores?  
 We don't need U,V,W,T,q,O3 on all 91 levels...

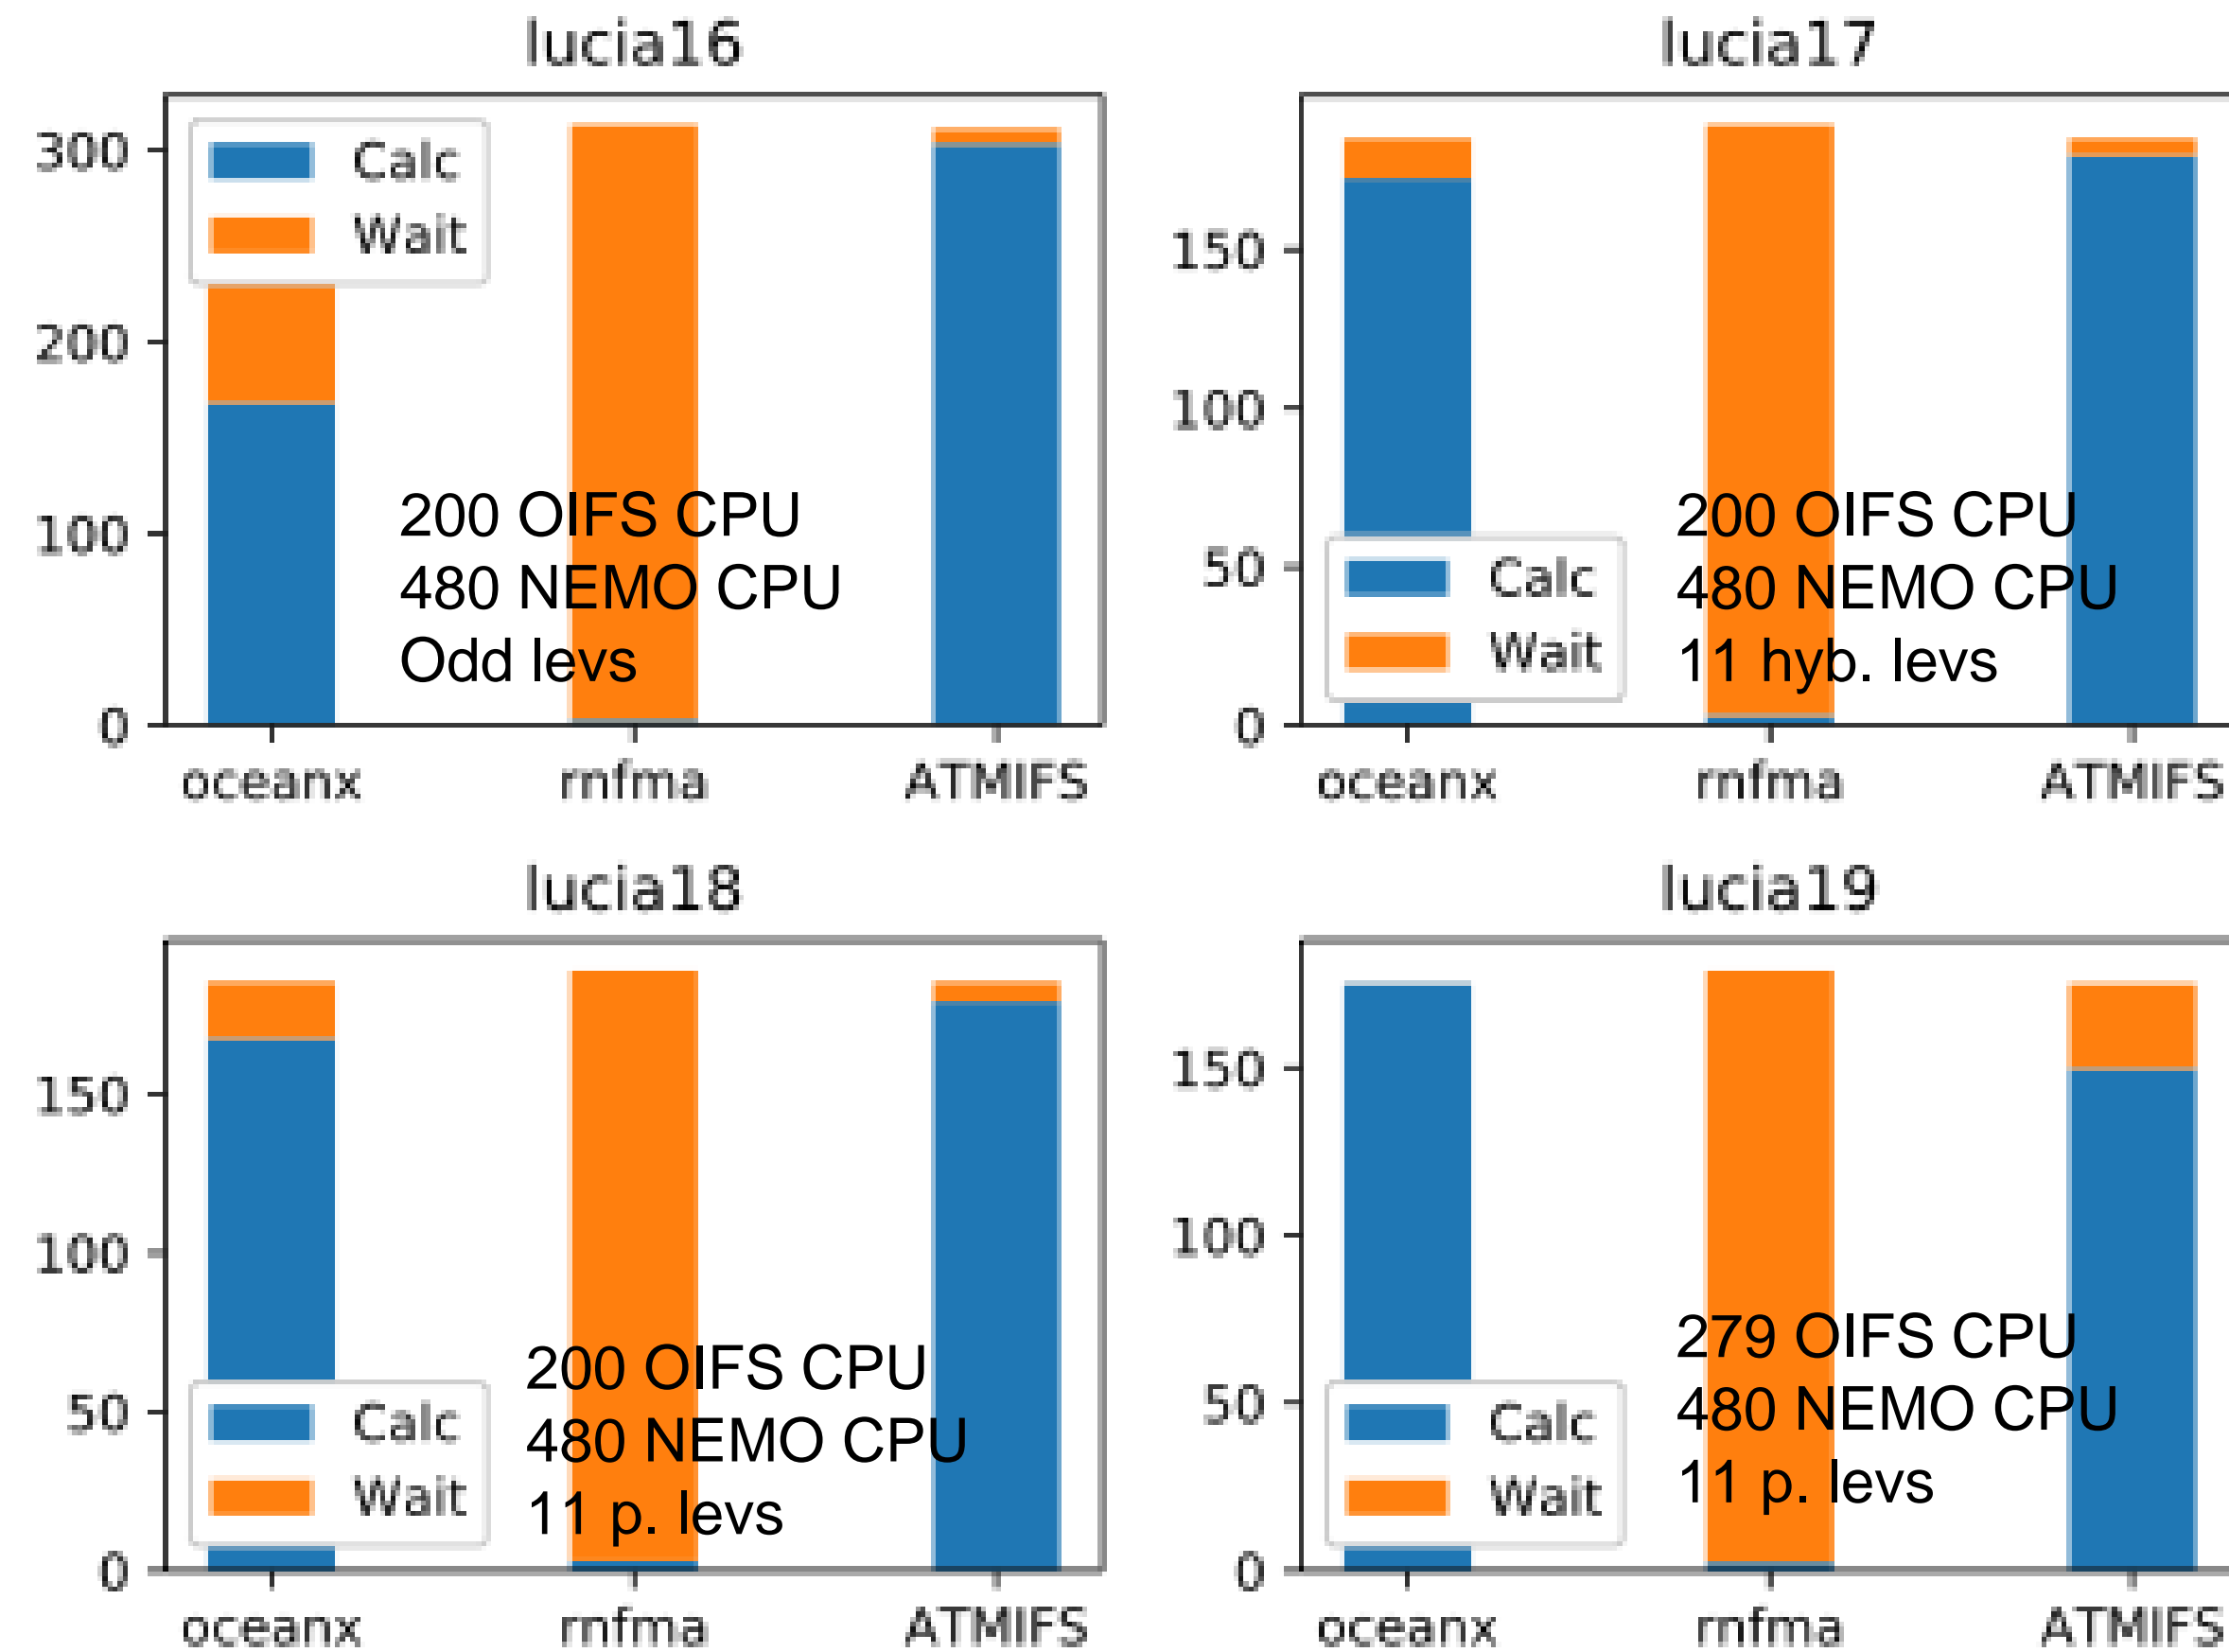

OIFS CY40R1 T159L91  
+ NEMO ORCA05  
+ OASIS3-MCT3

1 month = 744 OIFS steps,  
first 25 steps shown here.

Reducing output to 12-hourly  
and only odd levels leads to  
2.5 - 3x speed up!

Reducing output has a huge impact!

Using 279 CPUs lets us use all CPUs for calculations, but total NPLs are unchanged.

(There's also a lot of overhead for only 1 month run!)
