

Recent snow DA development at ECMWF

Kenta Ochi, Patricia de Rosnay, Gabriele Arduini, Gianpaolo Balsamo

Snow data assimilation at ECMWF

- **Observations:**

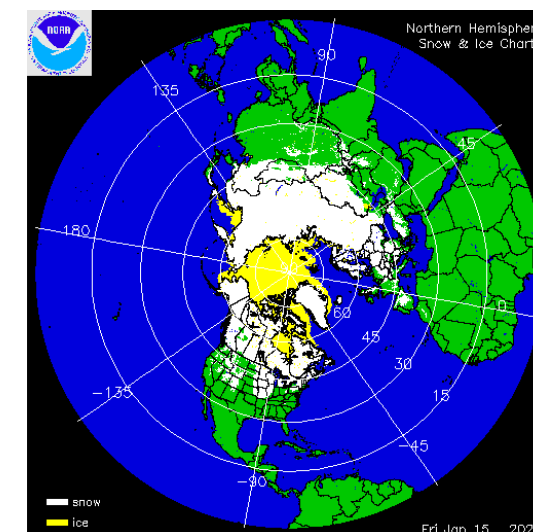

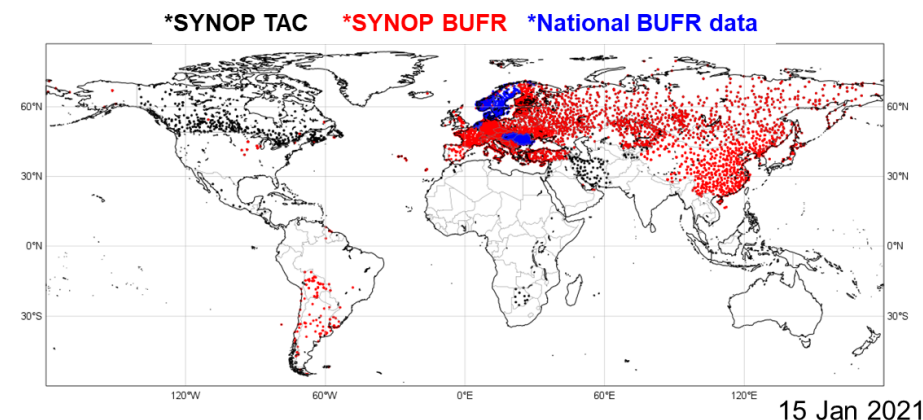

- Conventional snow depth data: **SYNOP** and **National networks**
- Snow cover extent: **NOAA NESDIS/IMS daily product (4km)**
 - Available daily at 23 UTC, assimilated in the next analysis at 00UTC

- **Data assimilation:**

- **Optimal Interpolation (OI)**
 - Based on horizontal and vertical structure function in Brasnett (1999)
- The result of the data assimilation is used to initialize NWP

- **One of current issues:**

- IMS assimilation below 1500m only, leading to excess snow depth on high mountains
- Especially on the Tibetan Plateau (Orsolini et al, 2019)

Snow DA and related model changes proposed for CY49R1

	Current system	Proposed for CY49R1
IMS mask	based on altitude (>1500m)	based on SDFOR* (>250m)
IMS thinning	select 1 from every 36	select closest 1 to a gaussian grid of 40km
IMS snow depth (SD_{IMS})	5cm	3cm
Condition to assimilate SD_{IMS}	$IMS=1$ & $SD_{model} < 10^{-9}cm$	$IMS=1$ & $SD_{model} < 1cm$
Capping value for snow depth	1.4m	3.0m
Vertical correlation length in OI	800m	500m

* Standard deviation of filtered subgrid orography

- To improve snow cover fraction for shallow snow, the SCF parameterization is changed to Niu and Yang (2007)

$$f_{sno} = \tanh\left(\frac{h_{sno}}{2.5z_{0g}(\rho_{sno}/\rho_{new})^m}\right)$$

- $z_{0g} = 0.1, \rho_{new} = 100, m = 1$ as with CLM4, CLM4.5

Impact on snow depth and snow cover fraction

- Snow depth is reduced by assimilating IMS on the Tibetan Plateau
- SCF is improved (increased) on the Tibetan Plateau and around snow lines by the SCF change

Impact on forecast skill in 2 winter seasons

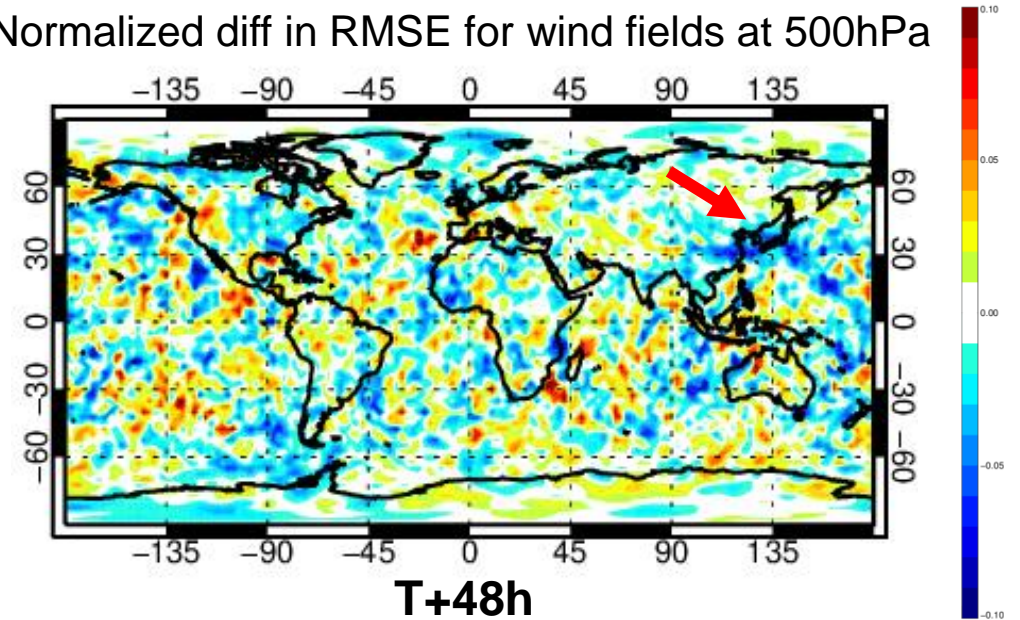

Winter 2020/21

Winter 2021/22

Normalized diff in RMSE for wind fields at 500hPa

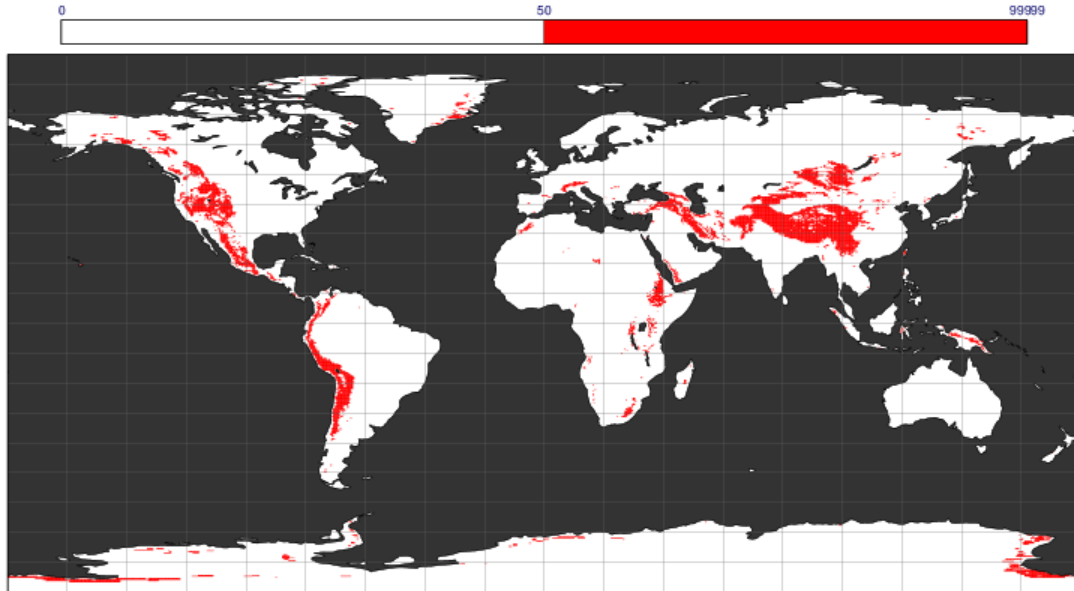

- Significant improvements in the NH, especially in East Asia
- Large impact of snow on forecast skill

Summary and ongoing works

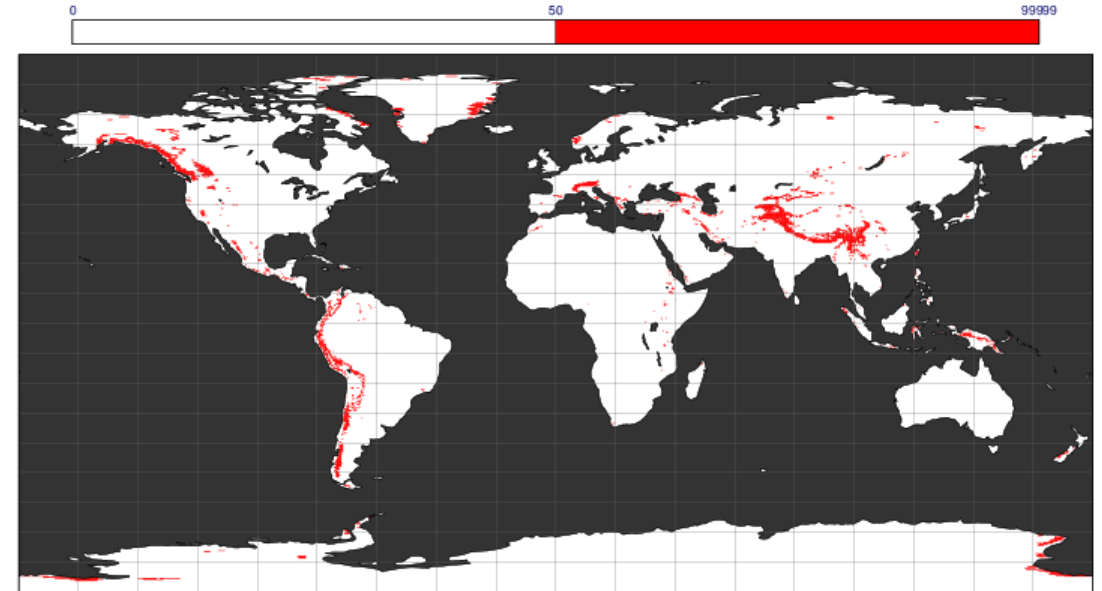

- Snow DA and related model changes have been tested for the next cycle
- The snow changes have large impact on forecast skill in the NH
 - Not only near surface temperature, but also in the mid-to-upper troposphere
- Ongoing works:
 - Implement snow DA in the offline LDAS for SEAS6 and ERA6-Land
 - ESA CCI Snow assimilation in ERA6
 - Snow DA in a unified multivariate ensemble-based LDAS (de Rosnay et al, 2022)

IMS mask

CNTL (altitude > 1500m)

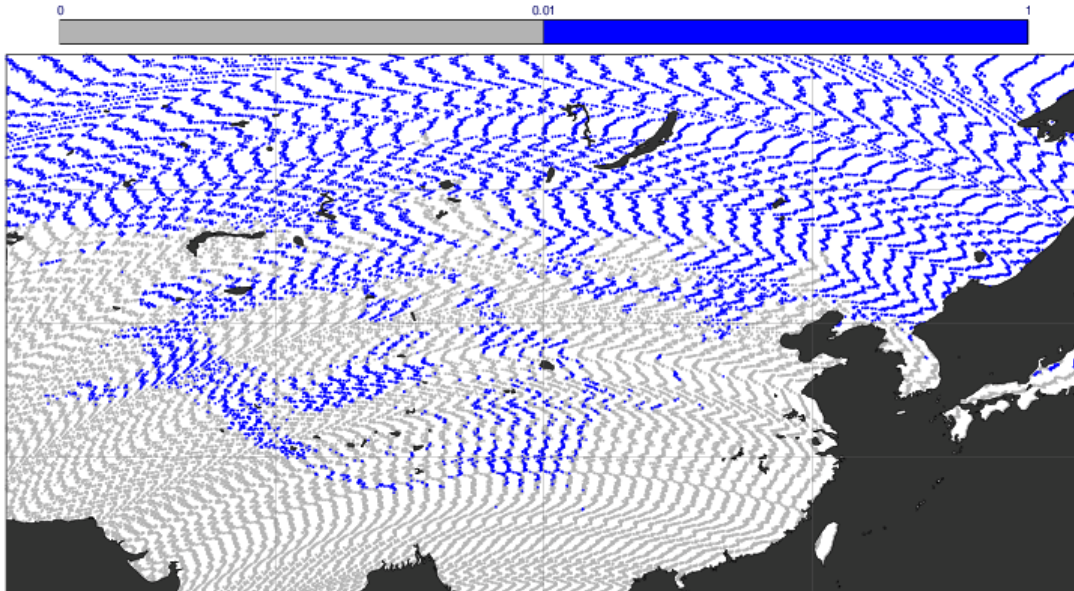

TEST (SDFOR > 250m)

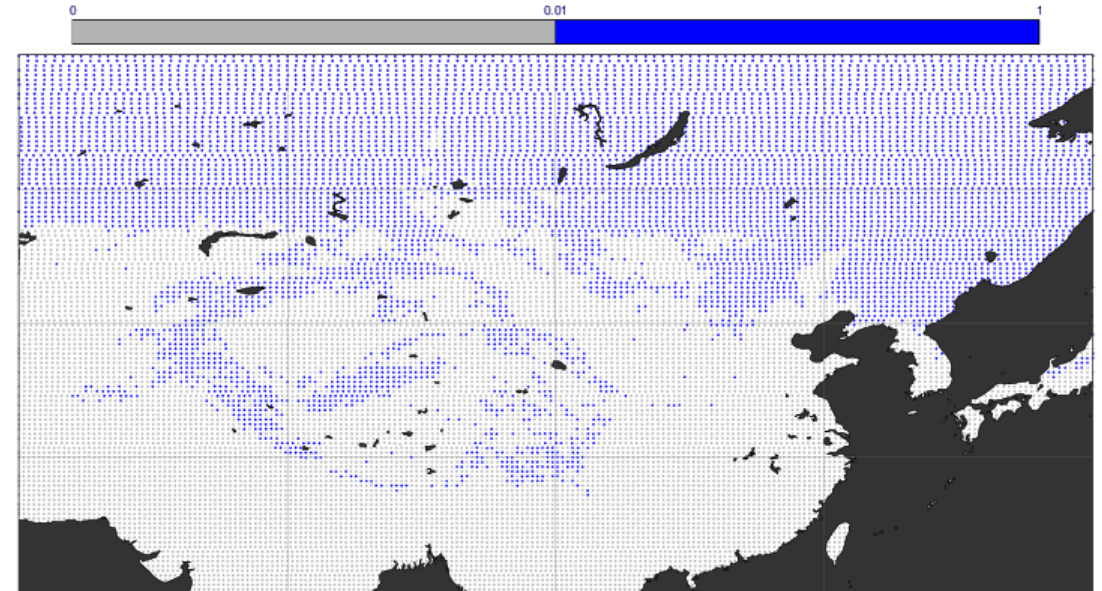

- IMS is **not** assimilated on the areas with red shading

Thinning for IMS

CNTL

TEST

- Number of IMS is reduced from 251926 to 70125
- More effective and efficient use of IMS
 - Considering the current horizontal correlation in the OI

Vertical correlation function

$$\beta(\Delta z_{ij}) = \exp\left(-\left[\frac{\Delta z_{ij}}{h}\right]^2\right) \quad \leftarrow \quad h \text{ is changed from } 800\text{m to } 500\text{m}$$
