

The ECMWF Extended range forecasts

Laura.Ferranti@ecmwf.int

ECMWF, Reading, U.K.

The operational forecasting system

High resolution forecast: twice per day Tco 1279 ~ 9km
137-level, to 10 days ahead

Coupled atmosphere-ocean system

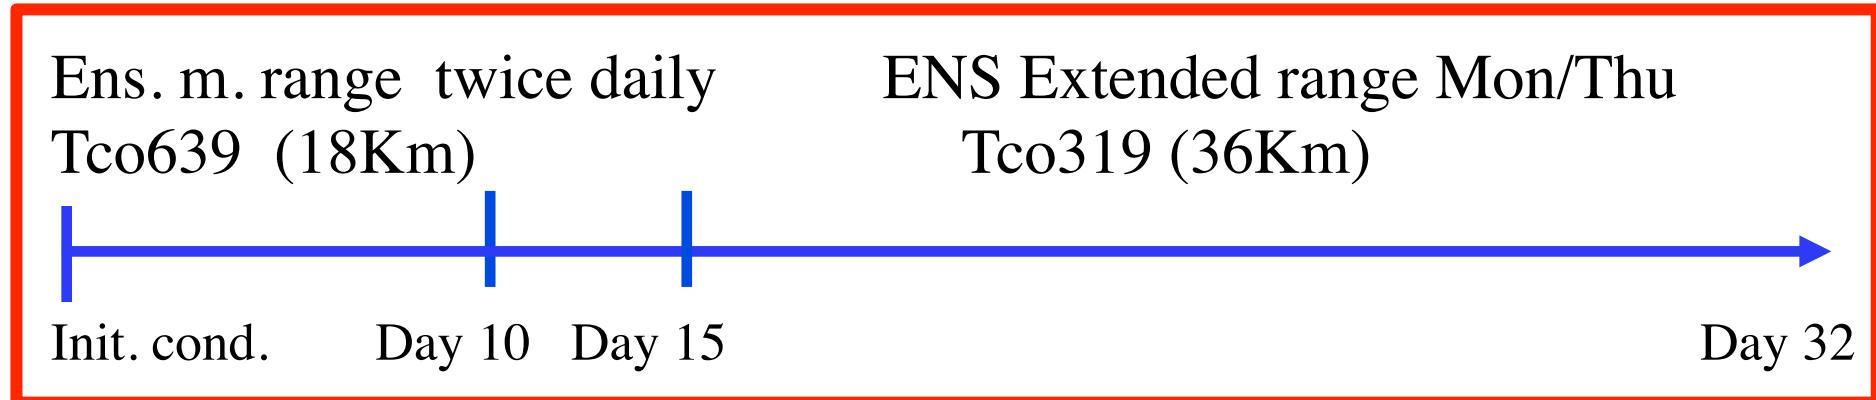

Ensemble Prediction System (ENS): twice daily TI 639/319 32/64 km 91-level, 51 members to 15 days ahead (next update Tco639 – 18Km)

Extended range forecasts /ENS extension: twice a week (Mon/Thu)
Tco 639/319 ~ 18/36 km 91 levels, 51 members to 46 days ahead

Long range forecasts: once a month 51 members, ~80 km 91 levels,
to 7 months ahead

Extended range forecast /ENS extension

Atmosphere

Initial uncertainties SVs+ EDA perturbations

Model uncertainties Stochastic physics (SPPT and SKEB schemes).

The central analysis is the Tco1279L137 4DVAR coupled to wave model (WAM) every time step

Ocean

NEMO (about 1 degree resolution) coupled to IFS every 3 hours.

Ocean initial conditions provided by 5-member NEMOVAR analysis

Bridging the gap between seasonal forecasting and NWP

- **Extended-range weather forecasting:** Beyond 10 days and up to 30 days description of weather parameters, usually averaged over a period of 5-7 days and expressed as a departure from climate values for that period.
- **A particularly difficult time range:** In fact at this time range is generally too long for the atmosphere to keep a memory of its initial conditions, and too short for the ocean variability to have an impact on the atmospheric circulation.

The ECMWF extended forecasts consists of 2 elements:

- **Real time forecasts**
- **A set of re-forecasts covering the most recent 20 years period**
 - the same configuration of the real time forecasts
 - 11-member ensemble integrated at the same day and same month as the real-time time forecast
 - It runs twice every week as the real-time forecast
 - Used to estimate the model drift

The ECMWF extended forecasts consists of 2 elements:

From Linus 's weather discussion 2016-08-12

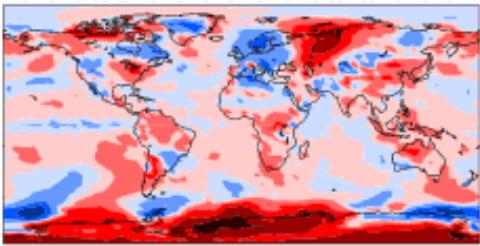

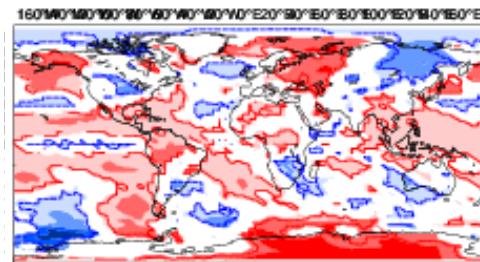

The Sub-seasonal to Seasonal (S2S) Prediction Project

- improve forecast skill and understanding on the sub-seasonal to seasonal time scale
- promote its uptake by operational centres and exploitation by the applications community
- special emphasis on high-impact weather events
- S2S data is available to everyone <https://software.ecmwf.int/wiki/display/S2S/Models>

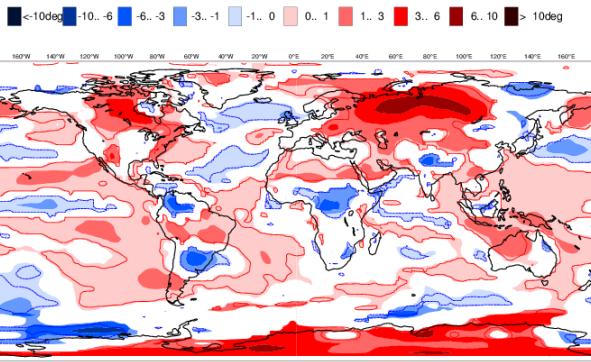

S2S products:

Conclusion

- SSTs, Soil moisture, stratospheric initial conditions and MJO are source of predictability at the intra-seasonal time scale. In particular the MJO has a significant impact on the forecast skill scores beyond day 20.
- The ENS produces forecasts for days 12-18 that are generally better than climatology and persistence of day 5-11. Beyond day 20, the skill is marginal but for some applications and some regions has some interest.
- Making improvements to sub-seasonal predictions, assessing their skill and uncertainty, and exploring ways to communicate their benefits to decision-makers are significant challenges. The S2S WWRP/THORPEX-WCRP joint project (<http://s2sprediction.net>) is embracing all these challenges and, to promote this research, has created a new database with a set of multi-model S2S reforecasts and forecasts freely available to the community.

weekly mean anomalies over Southern Europe: 2mt forecast 12-18

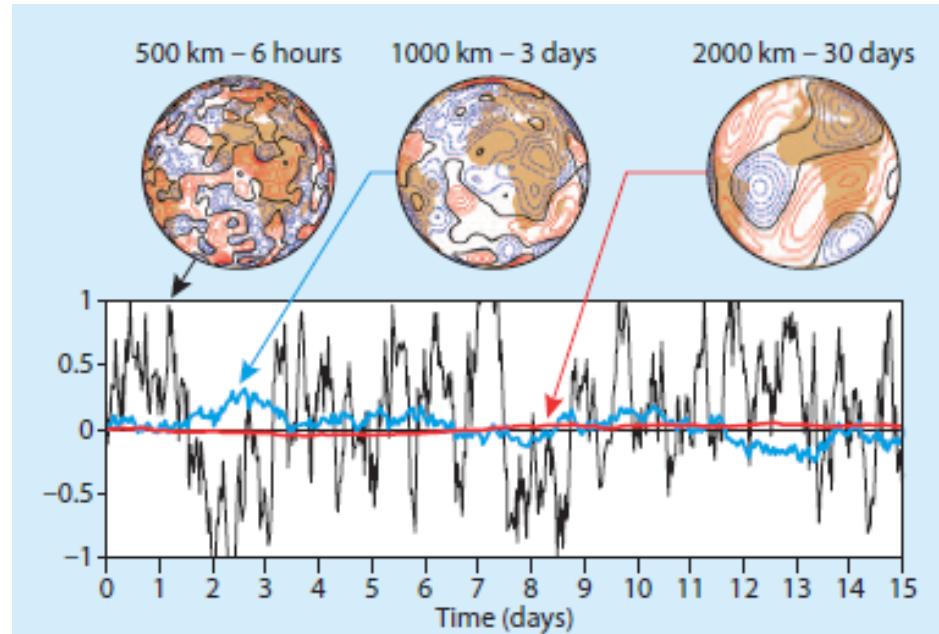

Stochastic Perturbed Parametrization Tendency (SPPT) scheme

Uncertainties in the model physical parametrizations can be a significant source of random error. This led to the development SPPT. It has been used in the since October 1998 there has been an increase in ensemble spread in the EPS and improved probability skill scores.

ECMWF Newsletter 129

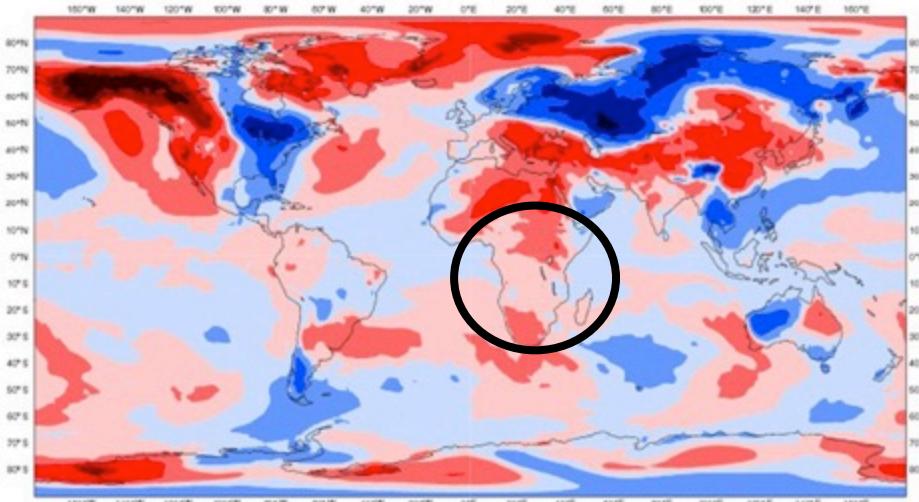

The three patterns underlying the SPPT3 scheme. The numbers next to the spheres indicate the horizontal spatial and temporal correlation scales in kilometres and hours. The three curves on the graph show time series of the pattern values at a point employed in the operational scheme. The colour of the arrows relates the patterns to the time series.

Stochastic backscatter scheme (SKEB)

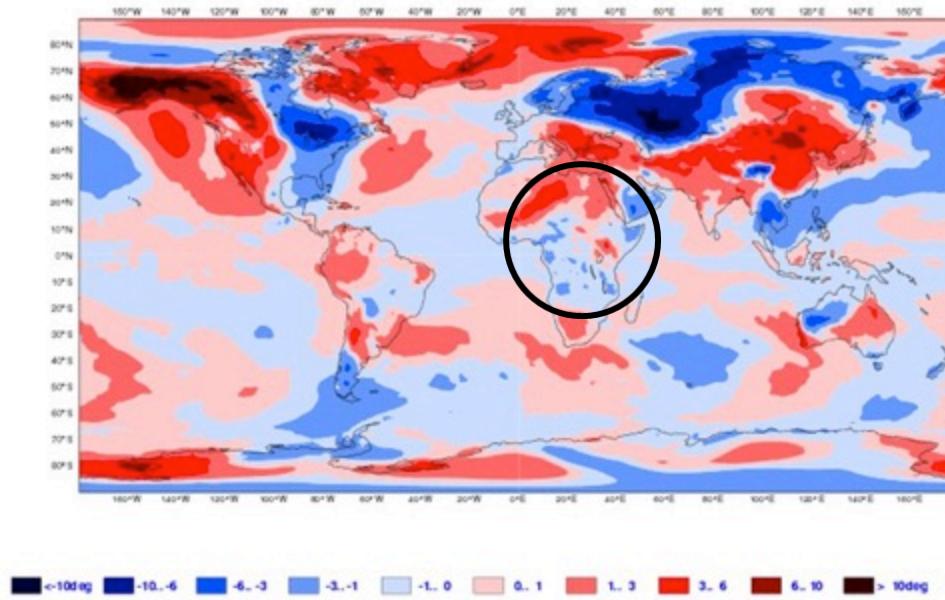

It compensates for the loss of energy in the model due to the Mis-representation of processes at sub-gridscale.
