Abierto, completo, gratuito

Climate  
Change

# What is the Copernicus Climate Change Service (C3S)?

authoritative quality-controlled data and information based on Earth Observation about the past, present and future climate;

tools to inform climate change mitigation and adaptation strategies by policy makers and businesses;

examples of best practice in the use of climate information.

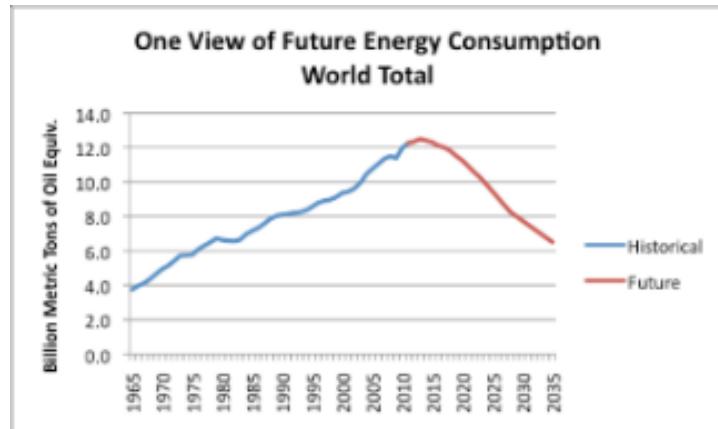

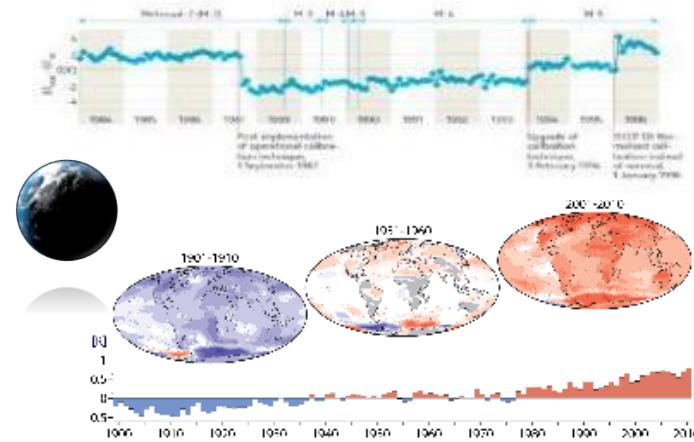

Climate  
Change

# El Servicio de Cambio Climático (C3S)

## Temas tratados en el servicio:

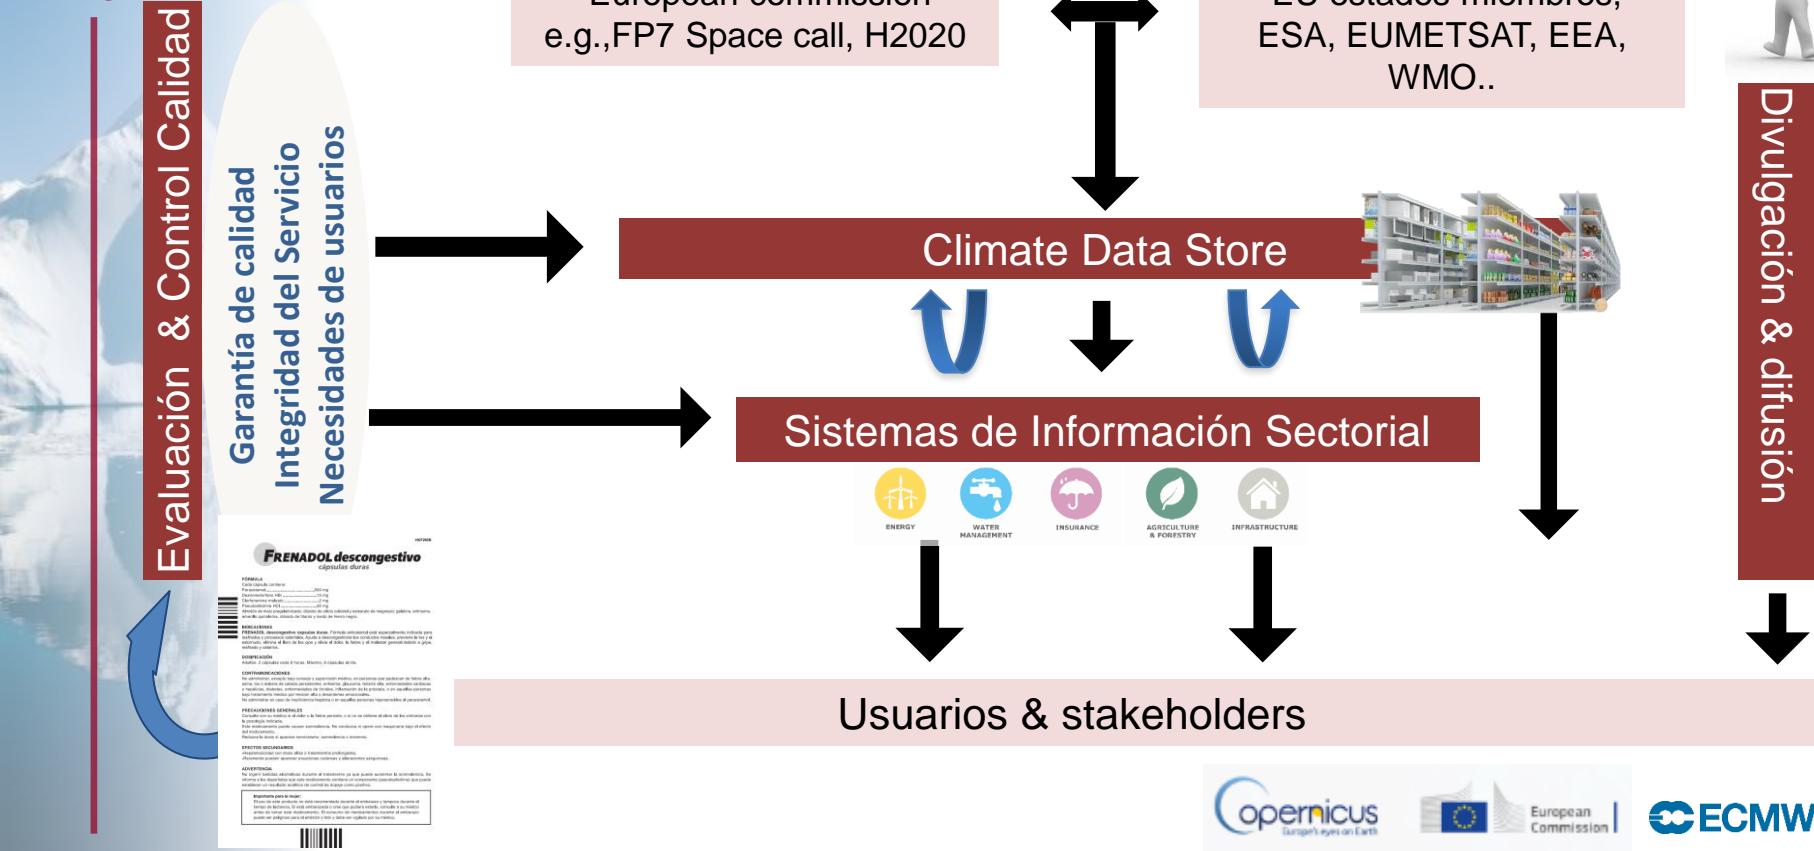

- Cómo está cambiando el clima?
  - Observaciones de la Tierra
  - Reanálisis
- Continuará/se acelerará el cambio climático?
  - Predicciones
  - Proyecciones
- Cuáles son los impactos en la sociedad?
  - Indicadores del clima
  - Información sectorial

Climate

# The Climate Data Store

The screenshot shows the CDS homepage with a red banner at the top. The banner features the Copernicus logo, the text 'IMPLEMENTED BY ECMWF', and the 'Climate Change Service' logo. It also includes a user profile for 'cedric.bergeron' and a 'Logout' button. Below the banner, a large red text box displays '116,000 + users'. The main content area has a white background with a grey header bar containing links like 'Home', 'Search', 'Datasets', etc. A central text block says 'Welcome to the Climate Data Store' and encourages users to register for free. Below this are three cards: 'Climate Data Store Toolbox' (with a line graph), 'Climate Data Store API' (with a code snippet), and 'Access the C3S Forum' (with a brain icon). At the bottom, there's a footer with the European Union flag, the Copernicus logo, and the ECMWF logo.

<https://cds.climate.copernicus.eu>

The Climate Data Store  
also called CDS, is an online  
open and free service.

It allows users to browse and  
access the wide range of climate  
datasets via a searchable  
catalogue...

... It allows users to build their  
own applications, maps and  
graphs

## ERA5 monthly averaged data on pressure levels from 1979 to present

[Overview](#) [Download data](#) [Quality assessment](#) [Documentation](#)

ERA5 is the fifth generation ECMWF reanalysis for the global climate and weather for the past 4 to 7 decades. Currently data is available from 1979. When complete, ERA5 will contain a detailed record from 1950 onwards. ERA5 replaces the ERA-Interim reanalysis.

Reanalysis combines observations into globally complete fields using the laws of physics with the method of data assimilation (4D-Var in the case of ERA5). ERA5 provides hourly estimates for a large number of atmospheric, ocean-wave and land-surface quantities. An uncertainty estimate is sampled by an underlying 10-member ensemble at three-hourly intervals. Ensemble mean and spread have been pre-computed for convenience. Such uncertainty estimates are closely related to the information content of the available observing system which has evolved dramatically over time. They also indicate flow-dependent sensitive areas.

The native resolution of the ERA5 atmosphere and land reanalysis is 31km on a reduced Gaussian grid (T1639) and 63km (TL319) for the ensemble members. Ocean-wave products are produced at 0.36 degrees and 1 degree for the ensemble. The atmospheric component consists of 137 levels in the vertical from the surface up to 1 Pa (about 80km). This spans the troposphere, stratosphere and mesosphere. There are both analysis fields and short forecast fields that link the assimilation windows used in 4D-Var. A detailed description can be found in the online ERA5 documentation. The full data set resides in the MARS tape archive.

The data presented here is a post-processed subset of the full ERA5 data set. It is online on spinning disk, which should ensure fast and easy access. It should satisfy the requirements for most common applications.

Data has been regressed to a regular lat-lon grid of 0.25 degrees for the reanalysis and 0.5 degrees for the uncertainty estimate (0.5 and 1 degree respectively for ocean waves). There are two main sub sets: data on pressure levels and data on single levels. The data on pressure levels contain 16 atmospheric quantities on 37 pressure levels from 1,000 hPa (surface) to 1 hPa (around the top of the stratosphere). Single-level data are available for a number of atmospheric, ocean-wave and land surface quantities.

Data is available on their hourly (three-hourly) resolution. To facilitate many climate applications, monthly-mean averages have been pre-calculated as well. Though, no monthly means are available for ensemble mean and spread.

Monthly mean updates are available about 3 days after the end of the month. Initial release data, i.e. data no more than three months behind real time, is called ERA5T. In the event that serious flaws are detected in ERA5T, this data could be different to the final ERA5 data. In practice, though, this will be very unlikely to occur. Based on experience with the production of ERA5 so far (and ERA-Interim in the past), our expectation is that such an event would not occur more than once every few years, if at all. In the unlikely event that such a correction is required, users will be notified as soon as possible.

The record in this page links to the "ERA5 monthly averaged data on pressure levels".

DATA DESCRIPTION	
Data type	Gridded
Horizontal coverage	Global
Horizontal resolution	Reanalysis: 0.25°x0.25° Ensemble members: 0.5°x0.5°
Vertical coverage	1000 hPa to 1 hPa
Vertical resolution	37 pressure levels
Temporal coverage	1979 to present
Temporal resolution	Monthly

### Sea ice monthly and daily gridded data from 1978 to present derived from satellite sensors

**Overview** **Download data** **Quality assessment** **Documentation**

This dataset provides daily values for sea ice concentration, sea ice edge and sea ice type and monthly values for sea ice thickness. These four variables are important markers for climate change studies since sea ice greatly influences the surface albedo and exchanges of energy, moisture and carbon. The sea-ice distribution, including polyynyas and margins, also has an important influence on marine ecosystems. Changes in the distribution of sea ice affect these ecosystems and a number of activities such as shipping, logistic and tourism operations.

Sea ice edge, sea ice concentration and sea ice type were computed from satellite passive microwave brightness temperatures from the series of SMMR, SSM/I and SSMIS sensors. Sea ice thickness were computed from Ku-Band radar altimeter measurements collected during the Envisat and CryoSat-2 satellite missions. Ice thicknesses from Envisat satellite (October 2002 to October 2010) have less coverage and higher uncertainty than thicknesses from CryoSat-2 satellite (November 2010 - March 2015), however the combined dataset provides a valuable unique observational record of sea ice variability.

From 1978 up to April 2015 the data records provided by this dataset have sufficient length, consistency, and continuity to detect climate variability and change. From April 2015 onwards, satellite data were processed using the same algorithms and processing environment but consistency and continuity have not been extensively verified.

This dataset is produced on behalf of C3S, with the exception of sea ice concentration which is produced at the EUMETSAT Satellite Application Facility on Ocean and Sea Ice (OSI SAF).

**DATA DESCRIPTION**

Data type	Gridded
Horizontal coverage	Sea ice concentration and edge: global ocean split in Northern and Southern hemisphere (Lambert A projection). Sea ice thickness and type: northern hemisphere (Lambert EASE2 projection).
Horizontal resolution	Sea ice concentration and edge: 12.5 km grid resolution (true spatial resolution is about 40-50 km and respectively). Sea ice thickness and type: 25 km grid resolution (true spatial resolution is about 1-10 km and respectively).
Temporal coverage	Sea ice concentration: 1978 to present. Sea ice thickness: 2002 to present. Sea ice edge: 1979 to present. Sea ice type: 1979 to present.
Temporal resolution	Sea ice concentration, edge and type: daily (every second day in the period 1978-1987). Sea ice thickness: monthly (Arctic winter months from October - April).

## ... with a robust CDS API access

The screenshot shows the CDS API interface. On the left, there's a search form with date filters (07, 08, 09, 13, 19, 25, 31, 14, 20, 26, 15, 21, 27), a 'Format' dropdown set to 'Zip file (.zip)', and a 'Terms of use' section with a checked 'GHG-CCI Licence' checkbox. Below these are 'Hide API request' and 'Show Toolbox request' buttons. A red arrow points from the 'Format' dropdown to the 'download.zip' line in the code editor on the right. The code editor contains Python code for retrieving satellite methane data:

```
import cdsapi

c = cdsapi.Client()

c.retrieve(
    'satellite-methane',
    {
        'format': 'zip',
        'processing_level': 'level_2',
        'variable': 'xch4',
        'sensor_and_algorithm': 'sciamachy_wfmd',
        'year': '2004',
        'month': '03',
        'day': '09'
    },
    'download.zip')
```

Please go to [the documentation page](#) for information on how to use the API.

```
import cdsapi

c = cdsapi.Client()

c.retrieve(
    'satellite-methane',
    {
        'format': 'zip',
        'processing_level': 'level_2',
        'variable': 'xch4',
        'sensor_and_algorithm': 'sciamachy_wfmd',
        'year': '2004',
        'month': '03',
        'day': '09'
    },
    'download.zip')
```

*pip install cdsapi*

... transforming workflows into public applications

Improved visualisation tools and caching system  
(for a very fast response time)

Click on a red circle to see the time evolution for that location.

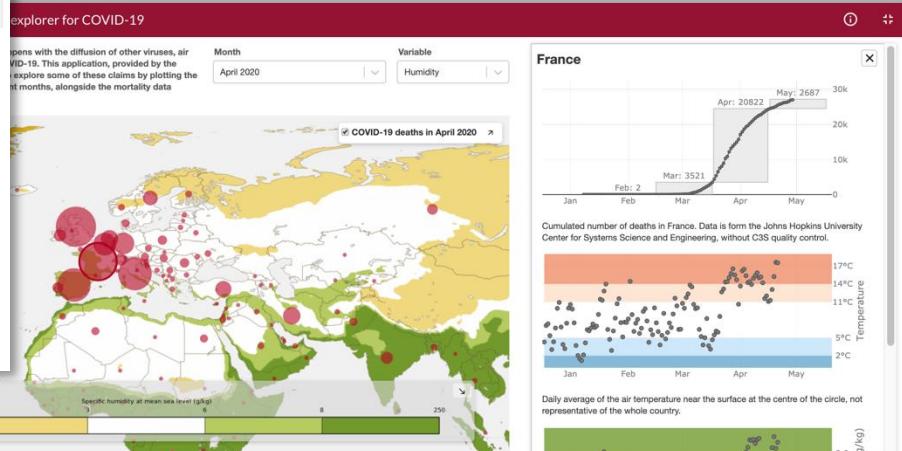

The white areas on the plots are regions where climate conditions are more conducive to the community diffusion of the disease according to recent scientific literature (Sajadi et al 2020, see documentation for details). Meteorological data are from ERA5 reanalysis: hourly data on single levels and pressure levels and monthly averages on single levels and pressure levels. For the upcoming months, the average values, based on the climatology of the most recent 20 years, are presented.

Disclaimers:

- COVID-19 related data are provided by Johns Hopkins University Center for Systems Science and Engineering (JHU CSSE), and are available at the following [GitHub repository](#). These are used in the application without any prior quality control by C3S.

### Climate change impacts on the biodiversity of Tropical Ecosystems

- Los objetivos de desarrollo de Costa Rica están muy ligados a la biodiversidad, energías alternativas y agua.
- Información climática de calidad es escasa y por tanto el apoyo a políticas futuras de adaptación al cambio climático es un desafío.
- ¿Se puede proporcionar información climática adaptada al territorio e indicadores de biodiversidad relevantes proyectados en el futuro para la protección de los hábitats naturales?

Resultados potenciales: Los resultados finales podrían ayudar las autoridades nacionales a la mejor gestión de áreas protegidas y el establecimiento de corredores biológicos (áreas sensibles al clima)

# Case study in the biodiversity sector

## Methodology

- global data (GCM and GCM-CMIP5 ensemble bias-corrected to Hydro-GFD at 50km)
- Local station data

Land-use based biodiversity indicators were calculated for the national bio-corridor program

Land-use based biodiversity indicators were calculated for the national bio-corridor program

Precipitation & temperature based on local interpolated station data

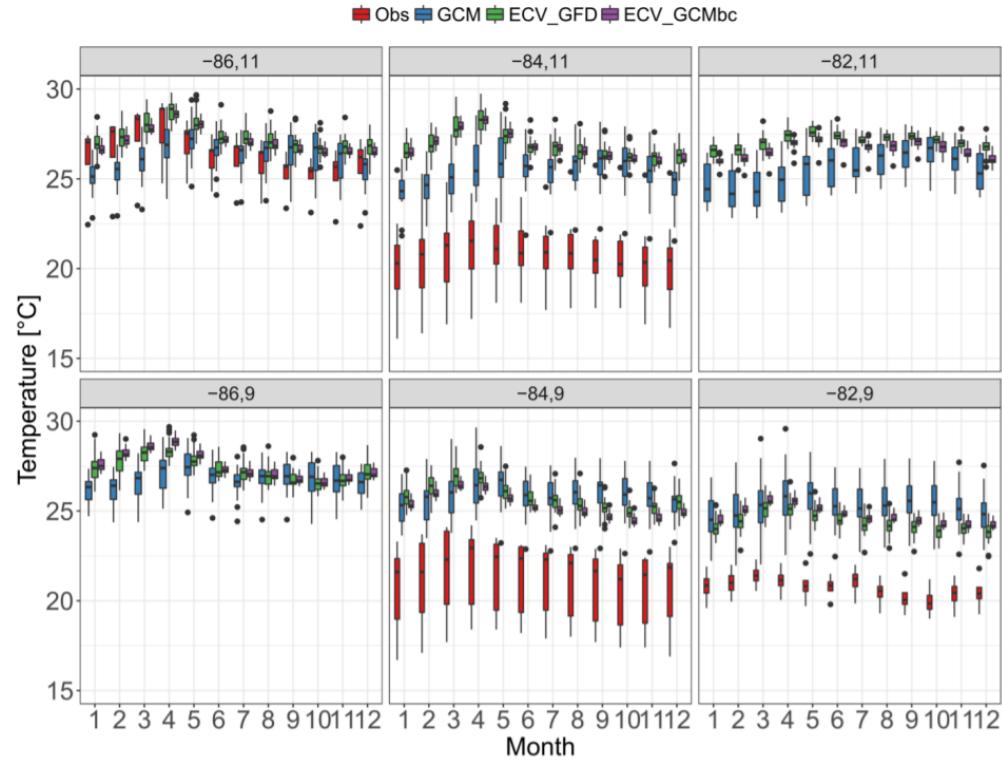

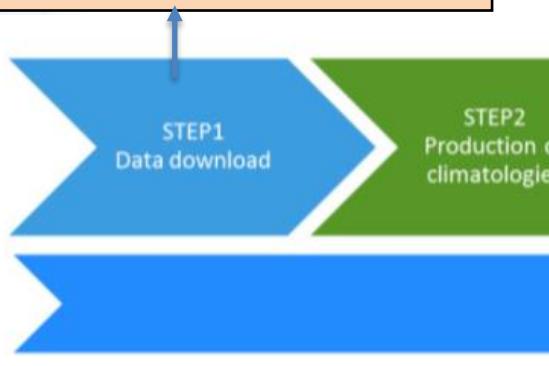

National Holdridge Life Zone (HLZ) ecosystem classification as a biodiversity indicator

## Methodology

Climate  
Change

## Case study in the biodiversity sector

### Methodology

Land-use based biodiversity indicators were calculated for the national bio-corridor program

### Conclusiones

- Probable tendencia de incremento de la temperatura media de Costa Rica alrededor de 1.5 °C hasta 2040.
- La tendencia de la precipitación muestra, en general, condiciones más húmedas y más prominentes en el Caribe y Pacífico Sur, aunque no se observa una sequedad en el norte de Costa Rica para el 2040.
- Cambios en los patrones actuales son mayoritariamente debidos a la tendencia de incremento de temperaturas en el país, independientemente de la altitud.
- Los cambios tienen más probabilidad de ocurrir a las alturas más elevadas, contrastando con los ecosistemas más resistentes a bajas altitudes.

→ Estos resultados pueden utilizarse para incrementar la resiliencia de los ecosistemas a través de medidas de adaptación para proteger los ecosistemas con mayor biodiversidad y más sensibles a cambios climáticos.
