What is ecFlow

ecFlow is a work flow package that enables users to run a large number of programs (with dependencies on each other and on time) in a controlled environment. It provides tolerance for hardware and software failures, combined with good restart capabilities. It is used at ECMWF to run all our operational suites across a range of platforms.

ecFlow submits tasks (jobs) and receives acknowledgements from tasks when they change status and when they send events. It does this using child commands embedded in the scripts. **ecFlow** stores the relationship between tasks and is able to submit tasks dependent on triggers.

Binary package notes

- At the moment these packages are still experimental. Please report any issue with them to Software.Support@ecmwf.int or via JIRA to <http://software.ecmwf.int/issues/browse/SUP>.
- Some components of ecfLOW are not available in some platforms. A minimum of python 2.5 is required to compile the **python** bindings and since some distributions ship with an older version we have chosen not to build the python bindings for those. In addition, **ecflowview** is not available for all platforms.
- We have a limited availability of build platforms for ecfLOW. If you want to have a binary for any platform not listed here you can tell us by sending an email to Software.Support@ecmwf.int or reporting it via JIRA in <http://software.ecmwf.int/issues/browse/SUP>. We can not cover all possible platforms but we are still interested on hearing from you
- Packages from version 4.0.0-1 onwards have divided the client and server parts of ecfLOW into two different packages: **ecflow** for the client side and **ecflow-server** for the server side. Please keep in mind that for a fully functional server you need both packages and that client and server versions must be matched.
