

Symbols 2 - Symbol with text

Symbol with text plotting

Note that these examples are only skeletons to illustrate the functionality of Magics.

You can download this [Jupyter notebook](#) from ECMWF [git hub space](#).

More about projections in [projection examples](#).

More about coastline plotting in [coastline examples](#).

Plotting in directly in Jupyter notebooks doesn't need output to be specified. Most of the time you will want an output.

To run this outside of Jupyter notebooks add this piece of code:

```
png = magics.output
(
    output_formats
    = ['png'],

    output_name_first_p
    age_number = "off",
    output_name =
    "symbol")
magics.plot(png,
cartesian_projectio
n, vertical,
horizontal,
topinput, toptext,
... centretext)
```
