

Switching between ecFlowUI version 4 and 5

One of the major differences between **ecFlowUI version 4 and 5** is that they can only interact with servers of the same major version. As a side effect if you start up ecFlowUI version 5 you will not be able to interact with any of your version 4 servers and vice versa.

To help the clear separation of ecFlow4 and ecflow5 related settings, from version **5.2.3** ecFlowUI will use **a new configuration directory**. As a consequence, you can create a **separate server list** for ecFlowUI 4 and 5.

You do not need to do anything, when you first start up ecFlowUI with a version $\geq 5.2.3$ the new configuration directory will be automatically created for you by copying the contents of the old configuration directory.
