

European Weather Cloud workshops in November

As part of the European Weather Cloud pilot project, EUMETSAT and ECMWF are happy to announce two further workshops this November:

- November 3rd: The Use case workshop is the next in a series of workshops to give updates on recent developments and discuss the next steps of the pilot with its users. The workshop also covers presentations from participants implementing use cases to share their experiences using the European Weather Cloud, and share important elements of feedback. Registration for the event can be found [here](#).
- November 10th: The “Cloud IT” technical workshop is organised to exchange on technical topics around the European Weather Cloud project and the main topics will include:
 - Technical overview of the storage and cloud infrastructures put in place by both organisations (E&E) covering architectures, experience and lessons learned and future next steps.
 - Security aspects and approaches providing a Community Cloud Service

We are keen to learn from other similar projects and encourage participants to contribute presentations on topics related to the above. Please register for this event [here](#).

Both workshops will be held virtually and be open to Member and Co-operating States of EUMETSAT and ECMWF. Registered participants will receive more detailed information on the agenda and instruction how to join the meetings in the coming weeks.
