

PBCLOSE

A subroutine which can be called from FORTRAN to close an unblocked binary file previously opened with PBOPEN.

The format and arguments for the subroutine are:

```
SUBROUTINE PBCLOSE( KUNIT, KRET )
```

Input parameter is an INTEGER.

PBCLOSE input argument

KUNIT	Index of a C file pointer obtained from PBOPEN
-------	--

Output parameter is an INTEGER.

PBCLOSE output argument

KRET	Status return code: 0, the close was successful -1, an error occurred when closing the file
------	---
